Nomenclature and Certification

Figure 1: Nomenclature

AHRI Certification

Certified in accordance with the forced circulation air cooling and air heating coils certification program, which is based on AHRI Standard 410.

Standard and custom size units certified in accordance with the central station air handling units certification program, which is based on AHRI Standard 430.

Labeled Vision units are tested and listed by ETL in accordance with UL 1995, Standard for Safety Heating and Cooling Equipment, and thereby fully comply with NFPA 90A material requirements.

IBC Certification (optional)

Seismic certification per applicable buildings codes tested and analyzed in accordance with:

**IBCO AC156
ASCE-7**

**IBC 2000, 2003,
2009, 2012
NFPA 5000**

VMC Seismic Consulting Group: Serial Number 39928V
Available upon request.

HCAI Pre-Approval (optional): OSP-0325-10

The Vision Air Handler Advantage

Flexibility	
Vision's unique design	What it can do for you
Custom-modular platform	Allows customizing of the system with a wide selection of components and sizes.
Variable Dimensioning™ design	Allows cabinet to be sized in two-inch increments (height and width) to meet installation or aesthetic requirements.
Ships assembled or by section	Minimizes install time; reduces installation cost; and allows passage through doors, tight spaces, and in elevators (great for retrofit jobs).
Multiple coil, fan and filter selections	Allows optimum selections for cost, energy efficiency, performance, indoor air quality, and low noise.
Wide selection of base rail heights (4" to 12")	Allows for condensate trapping, eliminates need for costly housekeeping pad, and provides space required between condensate connection and traps on steam applications.
Painted cabinet	Enhances exterior appearance for units in visible locations.
Indoor Air Quality	
Vision's unique design	What it can do for you
Low-leakage cabinet construction Standard Cabinet: less than 0.5 CFM/ft ² of cabinetry at design static up to +5/-6" w.c. High Pressure Cabinet: less than Class 6 leakage or 1% supply air volume at design static up to +/-8" w.c., whichever is greater	Minimizes air leakage, noise and unfiltered air.
Double sloped stainless steel drain pan	Inhibits bacterial growth; eliminates standing water that can support bacteria.
Double-wall, foam injected construction	Eliminates fiberglass fibers eroding into the air stream.
Multiple filter types (flat, angular, bag and cartridge) with side-load and front-load capabilities	Gives full range of filter efficiencies, final filter arrangements, and filter section depth flexibility.
Hinged access doors with full-grip handles	Allows for easy inspection and cleaning of drain pans; promotes regular inspections.
Patented splice collar	Prevents unfiltered, unconditioned air from entering the system. Allows for leak-resistant section to section joining in the field.
Easy-to-remove access panels	Allows for easy inspection and cleaning of drain pans; promotes regular inspections.

Operating Efficiency

Vision's unique design	What it can do for you
The low air-leakage cabinet design, all inside and outside panel penetrations are sealed	Increases operating efficiency; reduces energy loss and operating costs.
Patented gasketed frame channels	Minimizes direct exposure of metal to metal in cabinet framework to reduce cold bridging and condensate collection; lowers operating costs.
Energy recovery (plate heat exchanger or energy recovery wheel)	Reduces cost of heating or cooling outside air; recovers up to 50% of the energy normally exhausted from a building.
Fan selection options (housed forward curve or airfoil, belt-drive or direct-drive plenum, twin fans and ECM fan)	Results in lowest possible BHP requirements.
Patented UltraSeal™ low-leak dampers	Maximizes operating efficiency; reduces operating cost.
Double wall liners with injected foam insulation	R-13 insulation value reduces condensation and improves operating efficiency.

Easy, Low Cost Installation

Vision's unique design	What it can do for you
Ships assembled or by section	Minimizes install time, reduces installation cost; allows passage through doors, tight spaces and in elevators (ideal for retrofit jobs).
Complete disassembly	Allows for complete knock down during installation if required for tight fit applications.
Patented section splicing	Saves installation time; creates an airtight environment.
Extended coil connections with gasketed airseal, external drains and vents	Eliminates need to remove panels for connection during installation; preserves air-tight environment; saves time and cost.
Bolted frame construction with removable panels	Provides complete accessibility to unit components.
Fan system factory tested and balanced	Saves time during installation and promotes proper operation.
Discharge or inlet plenum sections	Adapts easily to ductwork and provides a turning section for stacked components.

Easy Maintenance and Serviceability

Vision's unique design	What it can do for you
Direct-drive plenum fans	No fan bearings, belts or drives to replace or maintain.
Removable cross-member frame channels	Allows for top or side coil removal without disrupting unit integrity.
Extended fan bearing lube lines	Makes lubricating fan system easier.
Extended coil drain connections	Reduces coil venting time; helps coil condensate drain completely.
Hinged access doors with full-grip handles	Allows for proper inspection.

Introduction

Quality

Daikin Applied air handling equipment has been respected and regarded as high quality for nearly 60 years. Daikin Applied has taken a major step in redefining the indoor air handler with the Vision air handler. Demands for improved indoor air quality, low sound, high operating efficiency and smaller mechanical rooms require a better product for today's air handler market. The Daikin Applied Vision air handler is designed to meet or exceed these demands.

The key to providing such a high quality product is in the basic design. The Daikin Applied Vision air handler's patented construction provides unequalled thermal efficiencies and low leak rates. In addition, Vision air handlers offer tremendous flexibility in sizing, component options, and unit arrangements to meet the indoor air quality, operating efficiency, sound and installation requirements for today's extensive commercial and custom markets.

Flexibility

By virtue of its unique frame design, the Daikin Applied Vision air handler offers tremendous flexibility. This flexibility is reflected in our unique Variable Dimensioning™ feature that allows units to be sized in two-inch increments (height and width) to fit the available space. Numerous section and component options, and the ability to arrange components in whatever arrangement is required, allow Vision air handlers to be customized to the requirements of each job, without expensive field modifications. Finally, Vision air handlers can be shipped as a completely assembled unit, in modules or by component sections for new or retrofit applications that require smaller sections for passage through the building.

Cabinet Construction

Daikin Applied Vision air handler cabinetry consists of a box-type frame channel—the backbone of the unit—and easy-to-remove panels or hinged access doors. The unique, patented frame channel design allows three identical pieces to be bolted together to form a corner of the unit. Channel material is G90 unpainted galvanized steel (optional—painted G60 galvanized steel) with neoprene gasketing on all flanges to minimize leakage. Gasketing is also factory applied at all contact surfaces between interior and exterior metal components to minimize thermal bridging. See [Figure 2](#).

Panels are secured to the unit with fasteners that can be easily removed to access the unit interior. The frame channel and panels are easily disassembled and reassembled, giving contractors tremendous flexibility in installing and servicing the units—even where space is limited—saving time and money. Patented splice joints ([Figure 3](#)) help guide sections together for a tight fit, saving additional time and money on installation.

Figure 2: Patented Gasketed Frame Channel

Standard Cabinet

This unique cabinet design results in air tight, thermally efficient units, which translates into energy savings over the life of the unit. Vision air handlers are capable of casing leakage rates that shall not exceed 0.50 CFM per square foot of casing surface area a design static pressure up to a maximum of +5" w.c. in positive pressure sections and -6" w.c. in negative pressure sections.

High Pressure Cabinet

The high pressure air handler construction utilizes laser welding technology to provide stronger frame channels and new gaskets to reduce the standard leakage rate to a casing leakage rate that shall not exceed ASHRAE 111 Class 6 or be no more than 1% of the supply air volume at design static pressure up to a maximum of +8" w.c. (whichever is greater) in positive pressure sections and -8" w.c. in negative pressure sections, where casing leakage (CFM/100 ft² of casing surface area) = $C_L \times P^{0.65}$. The high pressure air handler construction maintains the unique flexibility, ease of installation and serviceability that Vision has had for years while providing best-in-class air sealing.

ASHRAE 111 is the test standard to test duct leakage. The standard uses a class system to indicate relative leakage rates. These class levels are dependent on static pressure and surface area. The formula for leak class is:

$$C_L = \frac{F}{P^{0.65}}$$

where $F = \frac{\text{Leakage in CFM}}{100 \text{ ft}^2 \text{ Cabinet Surface Area}}$ and $P = \text{Static pressure in inches w.c.}$

To prove this construction works, full unit factory witness testing will be available for purchase.

Vision air handler panels use the latest technology to provide the lowest deflection, lightest weight and most importantly, the most thermally efficient 2-inch thick panel system available. R-13 insulation quality injected-foam is thermally pressed between inner and outer liners yielding an extremely rigid panel. The inner liner comes standard with galvanized steel or optional stainless steel. The outer liner standard is galvanized steel with options of pre-painted, or pre-painted heavy-gauge, galvanized steel.

Base rails are provided as an option on unit sizes through 21 square feet and are standard on larger units. They are available to meet jobsite height requirements, ranging from 4" to 12" and can eliminate the need for a housekeeping pad—saving time and money on installation. A full perimeter base rail per shipping section is factory assembled.

Figure 3: Patented Splice Joint for Section-to-Section Joining

Seismic Design Considerations

Strict design, testing, and certification requirements for heating, ventilating, and air-conditioning equipment are clearly defined in the International Building Code, versions 2000 and 2003, for designated structures in earthquake-prone locations.

The goals of these requirements are to maintain systems to protect the public from hazard and maintain essential public services immediately after an earthquake. With the widespread adoption of the IBC throughout the U.S., it is important to understand its requirements and their impact on your specific building, and where you can turn for equipment to satisfy those requirements. Tested and certified compliant with the seismic provisions of the IBC, Daikin Applied Vision and Skyline air handlers also comply with the construction requirements of NFPA 5000.

For use by the building official and design professional, the IBC has defined Seismic Use Group designations based on building use along with specific criteria for determining the Seismic Design Category of the building and the applicability of seismic design criteria to the building's mechanical equipment. Provide this information to your local Daikin Applied Sales Representative so the proper modifications can be made to the air handler and have a compliance label affixed to the product so all IBC requirements in this regard are complied with. For additional information, Daikin Applied has several published articles explaining in detail IBC seismic requirements. Go to www.DaikinApplied.com or contact your local Daikin Applied sales representative to obtain these articles.

Daikin Applied also has construction pre-certified for California's strict Department of Health Care Access and Information (HCAI) requirements. The OSP pre-approval shows that Daikin Applied has already completed testing to allow engineers to specify, contractors to install, and owners to operate equipment that will still work after a seismic event.

Access and Serviceability

Equipment must be designed to perform efficiently and withstand the wear and tear of everyday use. It must be designed to provide easy access to interior components for routine maintenance and service to maintain peak performance. The patented frame channels and easy-to-remove panels or hinged access doors of the Vision air handler cabinet provide complete access to the unit interior and components. Components, including the fan and coil assembly, can be removed through the side of the unit, top of the unit, or a combination of both, which reduces required service clearances ([Figure 4](#) and [Figure 5](#)). Coil removal on unstacked coils does not require access to the non-connection end of the coil. A unique coil tie down method simplifies coil removal and replacement.

Figure 4: Top and Side Panel, Frame Channel Removal for Component Replacement

Figure 5: Easy Access for Maintenance and Service

Daikin Applied SelectTools Software Selection Program

Because the Daikin Applied Vision air handler is so flexible and has so many different component types, there virtually are an infinite number of possible unit arrangements. To help the customer easily define their product requirements, Daikin Applied provides a user-friendly software selection program, called Daikin Applied SelectTools. This program configures and sizes both standard and custom units. Components can be selected in minutes. This Windows® based program leads the user through the selection process by prompting for pertinent input data for all components required. Component sections are selected by placing them on a configuration screen.

Once the unit layout is defined, the options and accessories are identified. The program gives immediate feedback regarding fan and coil selection, offering a choice of many different options based on the performance inputs. Once final component selections have been made, the program provides all output needed for specification and submittal purposes, including fan curves, coil performance psychometric charts, weights, dimensional drawings, and a unit specification. A fully detailed DXF file is also available. Daikin Applied SelectTools is a comprehensive, efficient, and user-friendly software selection program.

Vision's Unique Standard Features

1 Extended Coil Connections

- Reduces installation costs
- Grommet seal reduces leakage
- Reduces maintenance time

2 Patented UltraSeal™ Low-Leak Dampers

- Aids proper drainage
- Help maximize operating efficiency
- Reduces operating cost

3 Rugged Cabinet Enclosure

- Rigid, thermal efficient (R-13) injected-foam panels are strong and lightweight
- Promotes longer unit life

4 Smooth Interior Surface

- Reduces dirt accumulation
- Facilitates cleaning
- Helps improve IAQ

5 Gasketed Frame Channel

- Eliminates metal-to-metal contact between paneling and framework
- Minimizes cabinet condensate and corrosion
- Facilitates top and side component removal
- Promotes long life

6 Custom-Modular design

- Allows custom selection and configuration of components
- Allows design of system to meet space and performance requirements

7 Patented Splice Collar

- Reduces installation cost
- Creates an airtight environment

8 Frame Channel Disassembly

- Allows two-sided access.
- Easier, faster service and maintenance

9 Variable Height Base Rails (4" to 12")

- Eliminates costly housekeeping pad
- Allows for condensate trapping

10 Visible Double-Sloped Drain Pan

- Makes inspection and cleaning easier
- Helps improve IAQ

Vision Customized Options

Use Daikin Applied Vision product platform to build the ideal air handler for your specific application. Customized options include:

- Variable Dimensioning™ feature for flexible cabinet sizing on 2" increments (height and width)
- Galvanized or painted cabinet
- Multiple section depths
- Variable base rail heights (4" to 12")
- Various casing and drain pan materials
- Mixing boxes/economizers
- Sound attenuators
- Integral face and bypass dampers
- Blenders and air mixers
- Multiple coil section depths
- Energy recovery sections (heat wheels, fixed plate heat exchangers, and runaround coil loops)
- Multiple blower options including housed airfoil, belt- or direct-drive plenum, dual plenum and fan array
- Filters (flat, angular, bag and cartridge) available in side load and/or front-loading configuration
- HEPA filters in final filter location
- Gas-phase filtration
- Flush-mounted filter gauges
- Starters and inverters (VFDs)
- Disconnect switches
- Electric heaters
- Ultra-violet lights
- Inward opening doors
- Windows, doors, marine lights and receptacles
- Manual selections to accommodate special components
- Flexibility in shipping arrangements
- Digital Ready™ control components
- Humidifier manifold

Component Types

Fans

Fan types available with the Daikin Applied Vision air handling units are housed double width, double inlet (DWDI) forward curved and airfoil fans, plenum fans, twin fans and fan array. Forward curved fans generally provide the lowest first cost option and are used for lower static pressure applications.

DWDI Housed Fans

Daikin Applied housed forward curved fans will typically operate up to 6.0" of static pressure. Airfoil fans have a higher first cost, but are more efficient, quieter and can handle higher static pressures. Daikin Applied housed airfoil fans will operate up to 9.0" of static pressure.

Plenum Fans

Plenum fans (Figure 6) save space by eliminating turns in ductwork. They also provide a high degree of flexibility when locating the outlet ductwork. Plenum fans are also very good for blow-through applications as they generate a uniform outlet velocity profile. Both belt-drive and direct-drive plenum fans are available.

Direct-drive plenum fans offer easier maintenance as they do not have fan bearings, sheaves, or belts.

Dual Fans

Direct-drive plenum fans come with the optional dual arrangement. The multi-fan sets will provide more even air flow and redundancy if one fan should need servicing.

Table 1: Dual Fan Width Requirements

Direct-Drive Plenum Fan Size	Minimum Width (in.)	Minimum Standard Unit Size
11	64	010
12	64	010
15	68	014*
16	72	014*
18	80	017
20	88	030*
22	92	030*
24	100	035*
27	108	040

36	136	065
40	152	107 [†]
44	164	107 [†]

[†] Extended Cabinet

*Not on 4" width

For redundancy, the rule of thumb is that one fan will provide approximately 65% of the total CFM provided by both fans if the remaining fan is not sped up. If more redundancy is required, then a VFD and larger motor can be used to speed up the single fan to achieve more airflow. The selection software will calculate the redundancy. If a manual calculation is required to calculate the maximum available airflow from the single fan, manually plot the single fan performance onto the dual fan curve as in Figure 7. Extend the single fan rpm line to intersect with the system static pressure line. This balance point shows the performance of a single fan when one fails.

Figure 6: Plenum Fan

If a VFD is used, the fan can be sped up to the limit of the HP of the motor to get more airflow. To increase redundancy, a larger motor can be selected. Remember that over sized fan motors may be less efficient. This typically occurs below 50- 60% design bhp. If you over size the motor to increase redundancy, as the motor BHP drops farther away from the actual HP, the motor will run less and less efficiently. So, if the application is meant for dual fans, it may be best to simply use the best selection for efficiency and utilize what redundancy comes with this selection. This will ensure the customer will have the most efficient operating setup while having the insurance of good redundancy.

The width of the fans will determine which cabinets will allow certain fans. Table 1 will help by showing what minimum cabinet width and unit size you will need for specific fan diameter selections.

An optional motor removal gantry system is available for the Dual Plenum Fan and Fan Array options. The gantry option provides easier serviceability of motors if access is not available on both sides of the fan section.

Figure 7: Dual Fan Redundancy – 65% if one fan fails

Twin fans (two housed forward curved fans mounted on one common shaft) are excellent in both retrofit units and stacked energy recovery units. Twin fans can handle high cfm in very low profile units.

The different types of fans are available in numerous wheel diameters per unit size. The fan size selection is always optimized and identified by the SelectTools software. The program considers performance, efficiency, sound generation and first cost and offers a number of fan sizes to select from. Fan and motor assemblies can be provided with 2" spring (Figure 8), rubber in shear, or rigid mount allowing the customer the option of isolating the fan and motor assembly internally or isolating the entire unit. All fans are dynamically balanced at the plant as an assembly, including the motors and drives. All belt-drive fans rotate on a solid steel shaft of uniform diameter that has been ground, polished, and coated with a rust inhibitor. Fan shafts are selected to have a maximum operating speed well below the first critical speed.

Belt guards are available on plenum fans. Seismic restraint is also available for seismic active locations.

All single-speed motors are standard as premium efficiency, while 2-speed motors are high efficiency.

The fan bearings have a minimum L50 life of 200,000 hours, and are available as high as one million hours. Bearings are selected for minimum noise levels and minimal service. Bearings are self aligning and pre-lubricated for immediate use. Bearings are mounted on rigid frames and positioned to provide proper balance. All bearings include copper lubrication lines that are extended to the access side of the fan cabinet with the grease fittings located near the access door opening.

All fan motors are internally mounted. The appropriate motor size will be selected by the SelectTools software. Motors cannot be undersized, but may be oversized if desired. Motor options include open drip proof, totally enclosed fan cooled, 1 speed/1 winding, 2 speed/1 winding, and 2 speed/2 winding. Motor efficiencies available for high and premium efficiency, depending on the motor type.

Figure 8: Spring Isolation

Fan Array

The fan array section will decrease the fan section length by using multiple smaller direct-drive fans. With the stacked array, the fans will also provide a more even airflow pattern throughout the unit and will allow the fans to be placed closer to the coil. Multiple fans also provide redundancy, allowing the system to deliver full airflow and static pressure if a fan or motor is lost. All fans in the fan array are direct-drive and offer more efficient performance with no belt losses and no required shaft bearing maintenance.

The DDPL fan array section has fan diameters from 12–33 inches, with arrangements of up to 24 fans. Daikin Applied offers three motor control options to meet the highest level of redundancy. The array can be selected with a single VFD, a VFD per row or a VFD per fan. Each fan will come with an individual motor starter and backdraft prevention allowing complete isolation of any fan.

The ECM fan array section has a brushless, permanent magnet motor(s) for maximum efficiency. The inverter is integral to the motor. Each fan will come with an individual motor starter and optional backdraft prevention allowing complete isolation of any fan.

The optional Microtech 4 DDC controller offers advanced technology with adaptive algorithms making equipment configuration and Daikin Applied ECM fan array management easier. The controller is factory installed on the unit, with the option for remote mounting, and can be configured for constant air volume, variable air volume, or fan tracking applications. Fan performance can be monitored via standard, factory installed airflow measurement. System operation and diagnostic information is readily available via the on-board display, for simple, intuitive troubleshooting.

Figure 9: MicroTech 4 ECM Fan Option

Figure 10: Nine-Fan Option

Figure 11: ECM Fan Option

Coils

The Daikin Applied Vision air handler offers broad application flexibility in coil sections and coils. Coils can be arranged in draw-through, blow-through, and multi-zone configurations. Heating only, cooling only, or cooling and heating sections are available. All coils are installed with space between each coil to allow access for cleaning and mounting of controls.

Cooling coil sections, and cooling and heating coil sections, are available in seven different section lengths to accommodate every application requirement. Drain pans extend the full length of the section. Removable access panels or doors may be provided in the deeper sections that will not interfere with piping connections extending through the unit side panels.

All cooling coils are mounted over a double sloped drain pan. The cooling coil rests on coil supports located over the drain pan. The drain pan extends beyond the leaving side of the coil to help recover condensate. The primary drain pan also extends under the coil headers and return bends to help remove condensate from the unit. A full thickness of insulation is always provided between the drain pan and the bottom outer panel. The drain pan is sloped in two planes to promote proper condensate removal.

Coil connections are grommet sealed inside and outside to ensure low cabinet leakage, and the connections always extend through the unit cabinetry, allowing for the easy connection of valves and piping (Figure 12). Water coil vents and drains are located outside the cabinetry.

Coils are available in a range of face area sizes, including small, medium, medium extended, large, extended and staggered. Generally, small face area coils are used for heating applications, large face area coils are used for cooling applications with bypass, and extended face area coils are used to maximize the unit cross section for restricted space applications. The extended coil is used to maintain coil face velocity limitations to avoid going to a larger cabinet size, saving valuable floor space and money.

With Daikin Applied being a major manufacturer of heat transfer coils, the coil options are virtually unlimited. The Daikin Applied contractor coil line has several coil types, ranging from hot and cold water, refrigerant and steam. Standard Daikin Applied coils are AHRI certified. In addition to a broad range of circuitings, fin spacing and row depths, coils can be constructed of different material types for fins, tubes, connections, and casings. This provides the ability to specify a coil to meet the application requirements.

For more information on Daikin Applied coils, consult the following catalogs:

Cooling—water/refrigerant	Catalog 411
Heating—water/booster	Catalog 412
Steam—standard/distributing	Catalog 413

Figure 12: Coil Connections, Vents, Drains, and Drain Pan Connection, Extend Through Unit Cabinetry

Filters

The Daikin Applied Vision air handler is designed to house flat, angular, bag, or cartridge filters. These media types range in efficiencies up to 95% and MERV 15. (See Table 2 for a description of the MERV Rating.) In addition to offering a full range of efficiencies, the filter media can be provided with an optional antimicrobial treatment. Antimicrobial treatments are highly recommended for a complete filtration system.

Daikin Applied Vision air handlers can also be ordered with HEPA (MERV 17) filters. These filters have a minimum efficiency of 99.99% – 0.3 μ m.

An optional filter pressure gauge may be ordered with each filter section to help promote regular servicing and prevent clogging.

Both bag and cartridge filters have a pre-filter and can be either side load or front load. An access door is provided on either side or both sides of the unit to access the filter section. Filters can be positioned anywhere in the unit, and as many filter sections as required can be used. Many health and food industries require stringent filtration. Often, a filter section must be the last component in the air stream. The Daikin Applied Vision air handler meets these requirements by providing a filter section located as the last component in the air stream, and with full sheet metal liners.

Figure 13: Filter Particle Size Chart (in microns)

Figure 14: Pollutant Particle Size Chart (in microns)

What is the MERV Rating?

Minimum Efficiency Reporting Value (MERV)—ASHRAE Standard 52.2-1999 entitled "Method of Testing General Ventilation Air-Cleaning Devices for Removal by Particle Size" provides a methodology for determining filter efficiency at removing various sizes of particles (see [Figure 13](#)) as the filters become loaded. There are three ranges of particle sizes that define the MERV value:

Range 1—0.3 to 1.0 .m particle size.

Range 2—1.0 to 3.0 .m particle size.

Range 3—3.0 to 10.0 .m particle size.

The [Table 2](#) shows a comparison of the MERV rating to the average arrestance percentage by the older ASHRAE Standard 52.1 method:

Table 2: MERV Rating vs. AHSHRAE Standard 52.1

Standard 52.2 (MERV)	Approx. standard 52.1		Particle size range
	Dust spot efficiency	Arrestance	
15	>95%	n/a	1
14	90 to 95%	>98%	1
11	60 to 65%	>95%	2
8	30 to 35%	>90%	3
6	<20%	85 to 90%	3

Standard Filter Types Available:

- MERV 8 – 2" or 4" depth. Pleated filter with two layers of added polypropylene laminate to increase efficiency.
- MERV 13 – 2" or 4" depth without 1" track.
- MERV 14, 13, and 11 – 4" depth, 1" track requirement. Mini pleated filters with metal cell sides and headers that provide superior moisture resistance.
- MERV 14, 13, and 11 – 12" depth, 1" track requirement. Steel interlocked header and cell sides hold the corrugated aluminum separated pleats allowing optimum airflow. Rated UL Class 1.
- MERV 14, 13, and 11 – 12" depth, 1" track requirement. Mini pleats held in a V-bank configuration providing greater airflow capacity and longer service.
- MERV 15, 14 and 12 – 36", 30" and 22" depths, 1" track requirement. Extended surface pockets made from high-loft, layered synthetic media. Rated UL Class 1 MERV 8 efficiency filters also available in 19", 15" and 12" depths.
- HEPA (MERV 17)
 - 99.99% – 0.3 mm (HEPA)
 - 99.999% – 0.3 mm (ULPA)
 - 99.99995% – 0.1 to 0.2 mm (ULPA)

Ultraviolet Light Options

Vision air handlers can be factory equipped with ultraviolet (UV) light options that are pre-engineered for placement to provide maximum effectiveness. The first can be mounted on the downstream side of all cooling coils and above the unit drain pan for surface “kill” applications to comply with the GSA Facilities Standard for federal buildings. Agency approved to UL Category Code ABQK specification, HVAC Accessories, Air Duct Mounted, in addition to the ETL listing of Vision air handlers.

Access

Access sections can be selected to meet specific application criteria. They can be placed anywhere in a unit in a variety of depths and are available in depths of 16” – 54”. Typically, access sections are used for field-installed components, air monitoring devices, or to provide ample space between components.

Mixing Boxes and Economizers

When outside and return air mixing is required, either a mixing box or an economizer section can be selected. Either component will regulate the amount of outside and return air supplied to the conditioned space. The mixing box or economizer can make use of free cooling by opening outside air dampers when the ambient air will help to condition the supply air stream. Additionally, dampers may be individually sized to provide better mixing.

Both the mixing box and economizer are provided with a Daikin Applied UltraSeal™ low leak damper. This damper has one of the lowest leakage rates in the industry, maximizing energy efficiency. At 4.0” static pressure and a face velocity of 1100 fpm through the dampers, the leakage rate is less than 0.2% (it is common to specify leakage rates at higher static pressures, but dampers should not exceed 2” of static pressure). The parallel airfoil blades are hollow core and fully gasketed. Continuous vinyl seals are provided between the damper blades. Stainless steel end seals and linkage built into high strength ABS plastic endcaps provide smooth, quiet operation.

Face and Bypass Dampers

Face and bypass dampers can be provided to modulate temperature by bypassing air around the coil. The opposed blades meter varying air volumes through the coil and bypass to attain the final air temperature demanded. Daikin Applied Vision air handlers offer only low leak dampers in their face and bypass sections.

Three styles of face and bypass sections are available.

- Internal bypass is available for use with medium face area coils (Figure 15).
- External bypass and external right angle are used when larger face area coils are required. The damper blades are fabricated of continuous galvanized steel with the damper rods rotating in nylon bushings. Damper shaft extensions are supplied to facilitate damper motor location.
- Integral face and bypass. Vision air handlers are pre-engineered to provide an accurate, reliable method of preheating and tempering air in standard or make-up air applications. Integral face and bypass coils maintain constant steam pressure or tube velocities through the coil to help prevent freeze-ups, while varying airflow through the coil using bypass dampers. The amount of air bypassed or heated is determined by a preset leaving air temperature. It can vary from the bypass dampers being fully closed (all air passes through the coil) for maximum heat output, to the bypass dampers being fully open (no air passes through the coil) for minimum heat output. The air is then mixed at the discharge of the coil to achieve the desired leaving air temperature. Air pressure drop is maintained constant regardless of the position of the dampers.

Figure 15: Internal Face and Bypass Dampers

Blenders/Air Mixers

Stratification can occur from the mixing box when airflow from two different temperature air streams do not mix completely. This incomplete mixing can continue through the air handler and subject an unprotected coil (no glycol) to freezing temperatures, damaging the coil. With the increased minimum outdoor air requirements as identified by ASHRAE Standard 62, the likelihood for air stratification increases. An air handler must be able to handle the required amount of outdoor air, regardless of temperature, without risking damage to the coil.

Blenders/air mixers help to provide protection for coils against freeze-up due to stratification. They add additional turbulence to the passing air streams, boosting the air velocity for improved mixing. Proper distance is provided immediately downstream to give the air streams enough time to fully mix before reaching the next air handler component. Because blenders/air mixers are static devices, they require no maintenance. Different blender/air mixer lengths can be selected to satisfy either the acoustic, space, pressure drop, or initial cost requirements. The Daikin Applied SelectTools software can help select the appropriate blender/air mixer for the application.

Figure 16: Blender

Attenuators

Building occupants have become increasingly conscious of the quality of their environments, and low sound levels are a key criteria. Studies have confirmed improved productivity when workers are performing in sound-controlled environments. Consequently, building owners, engineers, and architects are designing their projects with stringent sound criteria to maximize this economic benefit.

Daikin Applied Vision air handlers are designed to provide quiet sound levels. Factory-installed attenuators are available for the discharge or return sections of the air handling unit to meet the most stringent sound attenuation requirements. Different attenuator lengths can be selected to satisfy either the acoustic, space, pressure drop, or initial cost requirements. Quality construction and an aerodynamic design give reliable performance, low pressure drop and low initial cost. The Daikin Applied SelectTools Software can help choose the correct attenuator for your application.

Figure 17: Attenuator Section

Digital Ready™ Air Handlers

Vision Air Handlers can be factory-equipped with industry standard direct digital control (DDC) components for easy, low cost integration with controls by others. Sensors and actuators are selected for maximum compatibility with most DDC control systems, and are neatly wired within their shipping section to a conveniently located junction box. Digital Ready Vision air handlers save the time and costly labor needed to identify, purchase and field install DDC components to match your control system. You also benefit from uniform, proper positioning of DDC components at our factory, which promotes reliable start-up and operation.

Starters and VFDs

A variety of factory-installed motor control options are available to provide operation and maintenance protection, motor efficiency, and flexibility for the Vision air handler. These options include: Disconnect Switch, Starters, Combination Starter/Disconnect, Variable Frequency Drive (VFD) with Disconnect Switch, and VFD with Disconnect Switch and Bypass. Line reactors are available on both VFD with Disconnect Switch and VFD with Disconnect Switch and Bypass.

A unit mounted disconnect switch provides the means for disconnecting power in sight from the motor when required by the National Electric Code (NEC). The switch is a heavy-duty type with a non-fused disconnect switch in a NEMA 1 enclosure. A fused disconnect is also available.

Factory mounted starters offer remote start/stop operation and overload protection for an individual fan motor with minimum field cost to wire line and control circuit power to the unit. All starters provided are NEMA rated. Additional options include auxiliary contacts, control transformer, selector switch, push buttons, and pilot lights. A combination starter is a starter packaged with a safety switch. These motor controllers provide remote start/stop operation as well as disconnecting means in sight of the controller.

A VFD provides adjustable speed control of a single fan motor. Factory mounted outside the fan cabinet, the VFD provides not only a lower cost than field installation, but also an optimal installation location. VFDs are preprogrammed and include a keypad for local or remote control.

A unit installed VFD with disconnect provides local or remote speed control for a single fan motor with disconnecting means within sight when required by the NEC. A non-fused disconnect is offered packaged with the VFD in a separate NEMA 1 enclosure. Installation is limited to the connection of power and control wires at the device.

Packaged VFD with disconnect and bypass offers added motor control at the unit for critical fan applications. With bypass control, power to the VFD can be switched to allow full operation of the fan motor in case of VFD failure. VFDs with disconnect switch, bypass and line reactors provide harmonic control when needed.

Energy Recovery

Maintaining acceptable indoor air quality is generally accomplished by introducing ventilation from outdoors. The air must be conditioned to match the indoor space requirements. Heat wheels and fixed plate heat exchangers are available as factory-installed options for Vision air handlers. These energy recovery components can recover 50% or more of the energy normally exhausted from a building. These devices capture heat from exhaust air as it passes through the air handler and transfer it to the supply air stream, reducing the cost of heating or cooling the outside air. Energy recovery components do this by transferring energy from a warm air stream to a colder air stream—heating cold outside air during the winter and cooling hot air during the summer.

The fixed plate creates a cross flow as it collects heat and conducts it to the other side of the plate. The fixed plate has no moving parts, is easy to clean, has a low pressure drop, can be sealed against cross contamination, and is offered in a wide range of configurations. Flat plate heat exchangers are offered in both sensible-only and enthalpy (sensible and latent) arrangements.

The heat recovery wheel rotates at low speeds, capturing and transferring both sensible (heat) energy and latent (moisture) energy. The ability to transfer both sensible and latent energy gives the heat wheel several advantages. First, the required capacity of ventilation equipment is significantly reduced. Additionally, the heat wheel works at lower temperatures without frosting. The supply air from the heat wheel is not near saturation, and moisture in the ductwork is not an issue.

Further, no condensate pan or drain is required. Finally, heat wheels provide humidification so that the humidifier can be downsized. They also help to keep humidity in spaces where humidification is not applied, providing greater comfort to these zones. Both types of energy recovery devices are configured on the inlets and outlets with splice collars to match the adjacent sections. The fixed plate requires two drip pans..

The side-by-side arrangement will often fit an energy recovery unit into spaces with height restrictions relative to the standard stacked arrangement. For example, if the application requires 9,000 CFM and bypass dampers, the stacked arrangement would require 108" in total height while the side-by-side would only need 72", but will require an added 62" in width. This arrangement will also allow easy access to both supply and return air streams since both are on the same level.

Since the diameter of the energy recovery wheel will often be the limiting factor of the unit height, the selection of the side-by-side arrangement will almost always require custom cabinet dimensions.

Electric Heaters

Electric heaters extend the versatility of the Vision air handler. With negligible air pressure drop, accurate controllability, light weight, easy serviceability and inherent freeze protection, electric heaters are valuable alternatives to conventional steam and hot water heating coils.

ETL-approved electric heaters are available on all standard sizes (003-090) for horizontally-mounted draw through units in both left and right hand configurations. All units are open wire style construction, with automatic and manual backup limit controls, air switch, stainless steel terminals, power on pilot light, magnetic contactors and integral control boxes. Safety interlock switches, step controllers and vernier silicon controlled rectifiers (SCRs) are available options.

The heater requires its own electric service. Heaters are available in 208V, 240V, 480V and 600V (all 3 phase) and use an internal 24-volt control circuit. Standard kW ranges are available for each heater size and are designed to give an approximate temperature rise from 20°F to 60°F, depending on the airflow through the unit. Typical pressure drops range from .01 to .04 inches of water, depending on the air velocity and number of rows of heating elements.

An integral control box with optional door handle power disconnect is included with the electric heater. Insulated panels are factory installed behind the control box. Any standard motor may be used, although the discharge air from the electric heater must not exceed 104°F since the rated ambient temperature of the motor will be exceeded. The heater is assembled into a separate section of the Vision air handler. Standard section widths include 30", 34", 42", and 46" and vary depending on unit size, control type and kW used.

Air Handler Selection

Selecting flexible Vision air handlers depends on many different criteria. The Quick Select tables on [page 25](#) and [page 26](#) provide a rough determination of air handler needs. To simplify this process, Daikin Applied designed an innovative computerized selection program—Daikin Applied SelectTools software. It allows the user to develop an air handler from the ground up and obtain all of the detail required for proper design and specification. The user can design a unit in a matter of minutes.

The program is completely integrated. All input data is carried through the selection process and considered as calculations are made. Because the program is integrated, the opportunity for errors is reduced. The software guides the user through the selection process. On-line editing helps select only viable options. The program is provided so that even the less experienced user can select air handlers accurately.

Designing an efficient air handler system depends on accurate system design and proper equipment selection. Factors that affect unit selection include applicable codes, ventilation requirements, heating and cooling space loads, acceptable temperature differentials, and thermal media and installation limitations. Unit selection can be broken down into four steps: unit type and size, coils, accessories, and fan and motor requirements.

Generally, the unit is selected based on the air volume required and the desired face velocity through the cooling coil. For cooling coils, 400 to 525 feet per minute is considered the optimum face velocity range for dehumidification and the prevention of any moisture carryover. The Daikin Applied SelectTools software recommends the unit size based on air flow and face velocity requirements. Once the unit size is determined, select the coils and all accessory components. Once all components and coils are selected (identifying the total internal component pressure drop), select the fan.

Selecting Coils

The Vision air handler provides the ability to select from multiple face area coils per unit size. Once the coil size is selected, the row and fin requirements can be determined based on performance criteria. Daikin Applied offers an extensive line of coil types and circuitings. This wide variety of circuiting, row, and fin spacing, in addition to different material types, can provide a coil selection that handles the load required.

Heating, cooling, and combination cooling and reheat sections are available. Coil sections come in many different depths to accommodate multiple rows of coils, and to provide access on the leaving air side or between coils for cleaning and inspection of the drain pan. Access in the coil section can be minimized or maximized depending on the space available and job needs. Coil sections can be placed as needed in the unit, and as many sections as required for conditioning of air can be provided.

Selecting Accessories

A complete selection of component and section types in a variety of unit arrangements and configurations is available for air mixing, filtration, and temperature control to meet specific application requirements. The outside and/or return air can be brought into the unit through a plenum, mixing box, or economizer. For mixing of the two air streams, dampers are required to modulate and direct outside and return air, which is accomplished using a mixing box or economizer. Both section types use the Daikin Applied patented UltraSeal™ low leak dampers. Blenders/air mixers also are available to provide proper mixing of two air streams, to prevent stratification and to help avoid damage to equipment due to freezing temperatures.

To promote good air filtration, many different filter media types and arrangements are offered. Filters can be provided in angular or flat filter racks, a variety of media efficiencies, and with or without a prefilter. The filter section can be located anywhere in the unit to filter air as it enters the unit, or in a final filter arrangement before it leaves the unit. Bag or cartridge filters can be either front or side loading.

Also available are many different size access sections for field-installed components or to provide access between components. Other options include diffusers, plenums, face and bypass dampers, sound attenuators, and blenders/air mixers. Standard access doors open outward for maximum accessibility to internal components.

On pressurized sections, most doors open inward to help maintain the extremely low cabinet leakage rate of the Vision unit and to prevent doors from being inadvertently opened when the cabinet is under pressure.

Selecting Fans

WARNING

SMOKE CONTROL AND MANAGEMENT SYSTEMS

Improper smoke or fume air handling can result in severe personal injury or death. A registered professional engineer must design and approve the air conditioner and air handler application to make sure smoke and fume control meet local fire codes and NFPA requirements for the specific building application.

Fan selection requires an accurate calculation of the resistance to the airflow through the entire system. This total resistance consists of the sum of two parts—the external and internal static pressure. The external static pressure is the static pressure found in the distribution system, external to the air handler. The internal unit resistance is the sum of the resistance of the coils and various other unit components and accessories. Component pressure drops are listed for specific air flows in this catalog.

Use the Daikin Applied SelectTools software to determine internal component pressure drops of the system. Once the total static pressure is known, the software identifies the fans available to properly handle the air flow and static pressure for the system. The software generates a full fan curve based on the fan selection and point of operation.

Quick Select Table

Table 3: Quick Select, Unit Sizes 003 to 021

Description	Unit size

Note: Based on typical industry sizes, Vision air handler units are available in 2-inch increments of height and width to fit the exact space requirements.

Application Considerations

Installation Flexibility

Daikin Applied central station Vision air handlers feature sectionalized design and can ship fully assembled or in sections as required by the job site condition to provide maximum installation flexibility. Multiple fan, coil, filter, mixing box, face and bypass, and access components allow the design flexibility of built-up systems with the cost advantage of factory fabricated units. Units can be shipped from the factory in as few or as many sections as required according to job site condition.

Mounting and Access

Whether units are floor or ceiling mounted, take care to keep the supporting structure level and rigid enough for satisfactory unit operation. Ideally, a heavy concrete slab should be used for floor mounted units and main support beams should be used for ceiling supported units. Ceiling suspended units must be trapeezed from the unit base rail or field-supplied materials. Avoid long floor or ceiling spans.

Locate units so there is proper access for routine service. Clearance for filter removal on both sides of the filter section is usually necessary. Provide clearance as required for access panels. Allow room for coil removal. Cooling units require clearance for a trap in the drain pan line.

Access to the interior of the Vision air handler is provided by hinged access doors or removable panels. For access between components, versatile access sections feature hinged access doors on either or both sides.

Ductwork

A well-designed duct layout minimizes system resistance and sound generation. Duct connections to and from units should allow straight, smooth airflow. Avoid discharge plenums or any abrupt change in duct size. Also avoid sharp turns in the fan discharge, particularly turns opposed to wheel rotation. If sharp bends are necessary, use turning vanes. See Figure 18 for good fan outlet practices.

Figure 18: Discharge Duct Layout

NOTE: Elbows should not be closer than 1-1/2 to 2-1/2 times the largest dimension of fan discharge opening. Place dampers at least 3 fan diameters downstream of the fan discharge.

Figures reprinted with permission from the 1979 ASHRAE Guide and - Data Book (Equipment).

Piping and Drain Pan Traps

Design and install piping in accordance with accepted industry standards. Do not apply undue stress at the connection to coil headers. Support pipe work independently of the coils with adequate piping flexibility for thermal expansion. Run drain lines and traps full size from the drain pan connection. Drain pans must have traps to allow the condensate from the coils to drain freely. On a draw-through unit, the trap depth and the distance between the trap outlet and drain pan outlet should be twice the negative static pressure under normal unit operation. See Figure 19.

Figure 19: Drain Pan Traps

Vibration Isolation

To help keep noise and vibration compatible with the intended use of the conditioned air space, apply good acoustical and vibration engineering practices during the early stages of design.

Since most applications require vibration isolation, the Vision air handler is available with factory-installed internal isolation. Internally isolated units feature spring or rubber in shear isolators sized specifically for each fan wheel and unit size.

Multi-zone Air Handler Applications

Blow-through air handlers are available in singlezone, two-deck, and three-deck configurations. The two-deck and three-deck units are offered with or without zone dampers. All unit configurations include a perforated plate fan discharge diffuser to provide even airflow downstream of the fan.

Multi-zone and dual duct air handlers typically provide comfort conditioning by distributing a constant air volume at variable temperature. In a typical system, a portion of the air is heated by passing through the heating coil; the balance is cooled by the cooling coil. The heated and cooled airstreams are then mixed in the required proportion to provide the optimum temperature air to the conditioned space.

For dual duct applications, a pair of ducts bring heated and cooled air to the air mixing terminal boxes where the airstreams are mixed. By adding zone dampers to the dual duct unit, the air mixing takes place at the unit discharge and only one duct is required to distribute conditioned air to the building. The air mixing terminal boxes also are eliminated.

By adding a third bypass deck to the hot and cold decks, a triple deck multi-zone is created. The triple deck configuration offers significant energy conservation opportunities by allowing return or outside air to bypass both coils. The thermal inefficiency of mixing heated and cooled air is eliminated by the addition of the bypass deck. Bypass air is mixed with heated air for building zones that require heating. Bypass air is mixed with cooled air for building zones that require cooling.

Multi-zone air handling systems result in an absence of water, steam and condensate drain piping, wiring, electrical and mechanical equipment in the conditioned space for more usable commercial floor area and higher rental income.

Sound

The unit inlet, outlet, and radiated sound levels for each octave band are calculated by the Daikin Applied SelectTools software, based on your specific application. Sound performance data is derived from testing performed in accordance with AMCA Standard 300. The effects of various components, casework, and unit configurations are taken into account.

Air Supply Systems and Fan Laws

An air supply system consists of an air handler cabinet, heat exchanger, filters, ductwork, grilles and registers used to distribute air throughout the building. The system is independent of the fan used to supply the system.

The resistance of the system, referred to as static pressure (SP), is dependent upon the quantity of air (cfm) that is moved through it. The air quantity is determined by the cooling, heating, and ventilating requirements.

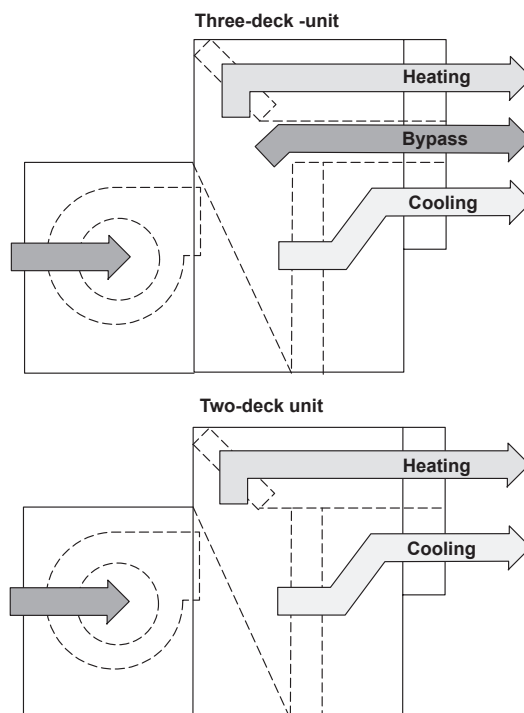

For any system, the static pressure varies directly as the square of the air quantity. This relationship between cfm and SP establishes the system curve for that system and is expressed as follows:

$$\left(\frac{cfm_1}{cfm_2}\right)^2 = \frac{SP_1}{SP_2} \quad \text{or} \quad SP_2 = SP_1 \left(\frac{cfm_2}{cfm_1}\right)^2$$

The system curve is unique for a particular system configuration. Any change to the system caused by dirty filters, damper changes, etc., results in a new system curve.

For fans operating at low pressures (less than 10" W.G.), the effects of air compression are negligible. Disregarding air compression allows fan operation in a fixed system to be expressed by simple relationships. These relationships are known as fan laws and can be used to calculate the effects of fan speed and air density changes on this system.

Figure 20: Blow-Through Handler Configurations

1 The flow rate varies directly with the change in fan speed:

$$\frac{cfm_1}{cfm_2} = \frac{rpm_1}{rpm_2} \quad \text{or} \quad cfm_2 = cfm_1 \left(\frac{rpm_2}{rpm_1}\right)$$

A 10% increase in fan speed increases air quantity 10%.

2 The static pressure varies as the square of the change in fan speed:

$$\frac{SP_1}{SP_2} = \left(\frac{rpm_1}{rpm_2}\right)^2 \quad \text{or} \quad SP_2 = SP_1 \left(\frac{rpm_2}{rpm_1}\right)^2$$

A 10% increase in fan speed increases static pressure 21%.

3 The fan brake horsepower varies as the cube of the change in fan speed:

$$\frac{HP_1}{HP_2} = \left(\frac{rpm_1}{rpm_2}\right)^3 \quad \text{or} \quad HP_2 = HP_1 \left(\frac{rpm_2}{rpm_1}\right)^3$$

A 10% increase in fan speed increases horsepower 33%.

4 System static pressure and brake horsepower are directly proportional to the air density:

$$SP_2 = SP_1 \left(\frac{\text{density}_2}{\text{density}_1}\right) \left(\frac{rpm_2}{rpm_1}\right)^3$$

$$HP_2 = HP_1 \left(\frac{\text{density}_2}{\text{density}_1}\right) \left(\frac{rpm_2}{rpm_1}\right)^3$$

Consequently, the static pressure and brake horsepower decrease with an increase in air temperature or higher altitude, and increase with a decrease in air temperature or lower altitude.

To determine fan performance for temperatures and altitudes other than standard (70°F, 0 ft. altitude), the static pressure must be adjusted by the density ratio before the fan rpm and bhp requirements can be determined. Density ratios are expressed as temperature and altitude conversion factors in [Table 5](#).

Table 5: Temperature and Altitude Conversion Factors

Air temp. (°F)	Altitude (ft)								
	0	1000	2000	3000	4000	5000	6000	7000	8000

Figure 21: Fan and Motor Heat Gain

Fan and Motor Heat

Motor and drive heat—The total energy input to any fan motor is consumed in two ways: by heat dissipated through the motor frame and by work output. The amount of heat dissipated by the motor is a function of its operating efficiency:

$$\text{Motor heat} = \text{input} \times (1 - \text{motor efficiency})$$

A small amount of the motor work output is dissipated by the drive mechanism, which also results in a heat gain. Belt-drive losses are a function of belt tension and number of belts as well as power transmitted. Typical belt-drive losses range from 2% to 6% of bhp.

Whether motor and drive heat gain become part of an air handling system cooling load depends on the motor location relative to the conditioned space. For air handlers with internal motors, the motor and drive are within the conditioned space. Therefore, the motor and drive add heat to the system. Subtract this heat from the cooling capacity and add it to the heating capacity of the unit.

Fan heat generation—All of the power input to a fan results in heat gain, which must be considered as a cooling load. The amount of heat generated is directly proportional to the fan bhp:

$$\text{Fan heat (Btuh)} = \text{bhp} \times 2545$$

Much of this heat generation occurs within the fan itself. Fans are not 100% efficient, and the energy losses that occur convert directly into heat. The work done by the fan on the airstream increases the temperature, pressure, and velocity of air. The heat of compression required to raise the airstream to this increased energy level is also a heat gain.

As the air travels throughout the building, its energy is deteriorated by friction, resulting in pressure drop. This is also heat gain, but it does not result in temperature rise because the air expands as the pressure is reduced. The expansion is a cooling process that offsets the heat generated by friction.

Typical fan and motor heat values are given in [Figure 21](#).

Variable Air Volume

Daikin Applied variable air volume systems (VAV) employ the concept of varying the air quantity to a space at a constant temperature thereby balancing the heat gains or losses and maintaining the desired room temperature. This true variable volume system is commonly referred to as a “squeeze-off” or “pinch-off” system. Unlike a “bypass” or “dump” system, supply air is diverted from areas where it is not required to areas that need cooling and, at system part load conditions, reduces the total fan volume. This ability to reduce supply air quantities not only provides substantial fan energy savings at partial load conditions, but it also minimizes equipment sizing.

Variable volume systems offer the following advantages:

- Lowers system first cost by using system diversity to reduce equipment and duct sizes.
- Lowers operating costs by reducing fan energy demands, especially at part load conditions.
- Lowers first cost by reducing space requirements for duct trunks and mechanical equipment.
- Provides system flexibility to match changing occupancy demands.

Variable Frequency Drives

Variable frequency drives offer reliable operation over a wide range of airflow, with advantages in sound and energy performance.

Variable frequency drives provide the most efficient means of variable volume control by taking advantage of the fan law relation between fan speed (rpm) and fan brake horsepower (bhp). Also, since airflow is reduced by changing fan speed, the noise penalties often associated with mechanical control devices, e.g. inlet vanes, are not introduced. The following equation illustrates how fan bhp varies as the cube of the change in fan speed: :

$$HP_2 = HP_1 \left(\frac{\text{density}_2}{\text{density}_1} \right) \left(\frac{\text{rpm}_2}{\text{rpm}_1} \right)^3$$

In an ideal system, at 50% fan speed, brake horsepower would be reduced to 12.5% of that at full speed.

Variable frequency control varies the speed of the fan by adjusting the frequency and voltage to the motor. Keeping a constant volts/frequency ratio (constant magnetic flux) to the motor allows the motor to run at its peak efficiency over a wide range of speeds and resulting fan airflow volumes. [Figure 22](#) illustrates on a fan curve the effect of varying air volume with a variable frequency drive.

Figure 22: Variable Frequency Drive Control

Figure 23: Coil Air Pressure Drop—HI-F5 Fin Type (2 Through 12 Rows)

NOTE: The letters A,B,C,D or E following the face velocity indicate the degree of wetness at which the coil is operating. Dry coils are shown by the letter A, wet coils by the letter E. Intermediate conditions are shown by the letters B, C, and D. Air pressure drop for odd fin spacings can be found by interpolation.

Figure 24: Coil Air Pressure Drop—E-F5 Fin Type (2 Through 12 Rows)

NOTE: The letters A,B,C,D or E following the face velocity indicate the degree of wetness at which the coil is operating. Dry coils are shown by the letter A, wet coils by the letter E. Intermediate conditions are shown by the letters B, C, and D. Air pressure drop for odd fin spacings can be found by interpolation.

Figure 25: Coil Air Pressure Drop—HI-F5 Fin Type

Figure 26: Coil Air Pressure Drop—E-F5 Fin Type

NOTE: Air pressure drop for odd fin spacings can be found by interpolation.

Figure 27: 1" Steam Coil Air Pressure Drop

NOTE: Air pressure drop for odd fin spacings can be found by interpolation.

* 3-row coils (unit sizes 080 to 090) based on staggered medium face area 5EJ with 6 FPI and standard fin, tube and casing materials.

** 4 to 8-row coils (unit sizes 080 to 090) based on staggered medium face area with 12 FPI and standard fin, tube and casing materials.

Notes:

• 1 and 2-row (unit sizes 003–065) based on large face area 5WQ and 5WH coils with 8 FPI and standard fin, tube and casing materials.

• 3-row and greater (unit sizes 003–065) based on large face area 5W* or 5E* coils with 8 FPI and standard fin, tube and casing materials.

• Staggered coils are not available in 10-row and 12-row coils.

Notes:

- Weight factor for 6" high rail = .52 lb/in (.00929 kg/mm)
- Weight factor for 10" high rail = .74 lb/in (.0132 kg/mm)

The base rail weight is determined by adding together the weight of the rail supports that run the length and width of the unit. The lengthwise support depends on the overall unit length. The cross member weight is dependent on the number of cross channels needed to support the unit. Each shipping section has a cross member located on each end. When a unit ships in one piece, the rail will have 2 end channel supports. When the unit ships in numerous shipping sections, each shipping section will have two end pieces. Fan, coil, and attenuator sections each must have additional cross member support on the entering and leaving air side of the section. If the coil section is adjacent to a fan, only one cross member is provided between them. A heating only coil section must have an additional cross member support on the entering air side. Any shipping section over 8' long requires an additional cross member.

Base rails are required on sizes 025 and above.

Example:

Determine the weight of a 6" high base rail for a size 8 unit that is 108" long, consisting of a fan, access, coil, and angular filter in a single shipping section.

Weight factor for unit length for a 6" curb is .52 lb/in

$$108" \times 0.52 \text{ lb/in} = 56.0 \text{ lb} \dots\dots\dots 56 \text{ lb}$$

Weight of end cross members for each shipping section is 41 lb each pair.

$$1 \times 41.0 \text{ lb} = 41.0 \text{ lb} \dots\dots\dots 41 \text{ lb}$$

Weight of additional cross members to support fan and coil sections. In this example the fan and coil are separated by an access section; therefore four extra cross member pieces are required for the fan and coil.

$$4 \times 15.0 = 60.0 \text{ lb} \dots\dots\dots 60 \text{ lb}$$

$$\text{Total base rail weight} \dots\dots\dots \mathbf{157 \text{ lb}}$$

Coil section depth limitation by number of rows in coil for single banks of coils (excludes staggered coils)
Section depth Maximum number of rows

12" (305) 2-row water or steam
 14" (356) 4-row water (except 5WM and 5WD)
 16" (406) 4-row 5WM & 5WD water

Cooling only section (no moisture eliminator)

Section depth Maximum number of rows
 18" (457) 4-row DX or water (except 5WM and 5WD)
 24" (610) 8-row DX or water
 30" (762) 10-row DX or 12 water

Combination cooling and 1-row or 2-row reheat (no moisture eliminator)
Section depth Maximum number of rows

24" (610) 6-row water or DX
 30" (762) 10-row water or DX
 36" (914) 12-row water

Notes: Spacing between coil casings is a minimum of 4". If more access between coils is required, increase section depth. Cooling coil sections are available in section depths of 18" (457mm), 24" (610mm), 30" (762mm), 36" (914mm), 42" (1067mm), 48" (1219mm), 154" (1372mm). If a moisture eliminator is required, use the next larger section size.

Multi-zone Coils

The face area of the multi-zone cold deck coil is the same as other cooling coils shown in [Table 18 on page 48](#). Multi-zone hot deck coils have a face area that is different from other heating coils. The face area for the multi-zone hot deck is generally smaller.

The minimum section depth for multi-zone sections is shown starting on [page 69](#). Additional access is available downstream from the cooling coil. Refer to Daikin Applied SelectTools Software for more detailed information.

Table 19: Multi-zone Coil Dimensional Data

Multi-zone hot deck coils			
Inches/square feet (millimeters/square meters)			
Unit size	Coil Dimensions	1-row & 2-row	3-row & 4-row

* Not available with vanes.

** These are the dimensions of the unit only. A standard base rail adds 8" (203 mm) to the width, and between 4" to 12" (102 mm to 305 mm) to the unit height. A 6" (152 mm) base rail is mandatory on unit sizes 025-065. An 8" (203 mm) base rail is mandatory on unit sizes 080 and larger.

The drawing consists of two views: a Plan view and an Elevation view.

Plan View: Shows a square duct with a 2.00 inch width and a 3.00 inch height. A dashed line indicates the internal structure, including a circular orifice. The duct has a 1 inch flange. Dimensions A, B, C, D, E, F, G, H, and I are labeled.

Elevation View: Shows the duct with a circular orifice of diameter C. The duct has a 1 inch flange and a 1.25 MPT connection. Dimensions A, B, C, D, E, F, G, H, and I are labeled.

* Not available with vanes.

** These are the dimensions of the unit only. A base rail adds 8" (203 mm) to the width, and between 4" to 12" (102 mm to 305 mm) to the unit height.
A 6" (152 mm) base rail is mandatory on unit sizes 025 to 065. An 8" (203 mm) base rail is mandatory on unit sizes 080 and larger.

Belt-drive Plenum Fan Discharge

Table 29: Belt-drive Plenum Fan Dimensions

Unit size	Fan diameter (Inches)	A*, In. (mm)	B*, In. (mm)	C, In. (mm)	D**, In. (mm)

050	44.0 AF	120 (3048)	80 (2032)	56 (1422)	30 (762)
050	49.0 AF	120 (3048)	80 (2032)	60 (1524)	30 (762)
065	54.0 AF	136 (3454)	92 (2337)	64 (1626)	36 (914)
065	60.0 AF	136 (3454)	92 (2337)	68 (1727)	36 (914)
080	54.0 AF	136 (3454)	98 (2489)	64 (1626)	38 (965)
080	60.0 AF	136 (3454)	98 (2489)	68 (1727)	38 (965)
085	54.0 AF	136 (3454)	104 (2642)	64 (1626)	40 (1016)
085	60.0 AF	136 (3454)	104 (2642)	68 (1727)	40 (1016)
090	54.0 AF	136 (3454)	110 (2794)	64 (1626)	42 (1067)
090	60.0 AF	136 (3454)	110 (2794)	68 (1727)	42 (1067)

* These are the dimensions of the unit only. A standard base rail adds 8" (203 mm) to the width, and between 4" to 12" (102 mm to 305 mm) to the unit height.
A 6" (152 mm) base rail is mandatory on unit sizes 025 to 065. An 8" (203 mm) base rail is mandatory on unit sizes 080 and larger.

** This value represents the height for an optional top plenum. Additional discharge openings include axial, top and single opening, opposite drive side, bottoms single opening, split and removable panels. Use Daikin Applied SelectTools software for more detailed dimensional information.

090	44 AF	272 (6909)	110 (2794)	74 (1880)

* These are the dimensions of the unit only. A standard base rail adds 8" (203 mm) to the width, and between 4" to 12" (102 mm to 305 mm) to the unit height.

A 6" (152 mm) base rail is mandatory on unit sizes 025 to 065. An 8" (203 mm) base rail is mandatory on unit sizes 080 and larger.

** This value is dependent on motor frame size.

Coil Section

Cooling Coil Section

The single cooling coil section is available in numerous depths. This provides the option of varying the amount of space downstream from the coil for access to inspect and clean the coil and drain pan. When using a single bank of coils, the 18" deep section holds up to a 4-row water or DX coil.

Also available are staggered cooling coils. The staggered arrangement maximizes the cooling coil face area by providing two banks of coils. These two coils are not stacked, but are staggered in the direction of airflow. This configuration does require more section depth in the direction of airflow. Staggered coils are only available on unit sizes 025 and larger.

The section depth required varies between 30" to 54". This depends on the unit size and number of rows in the coil.

When a coil section is used in a vertical application, the section must be deep enough to support the fan above it and keep the face velocity through the top opening below 1000 fpm. The coil section should be a minimum of 36" deep in direction of airflow. As the fan and airflow get larger, it may be necessary to add a plenum downstream from the coil section. Drain connections for units with width **A** greater than 108", in Table 34, are 1.50 MPT.*

Table 34: Cooling Coil Dimensions

Unit size	A* (large, medium coils) In. (mm)	A* (extended coils) In. (mm)	B* In. (mm)	18" - 54" In. (mm)
003	38.0 (965)	44.0 (1118)	26.0 (660)	18.0 (457) to 54.0 (1372) In 2" increments
004	40.0 (1016)	46.0 (1168)	30.0 (762)	
006	52.0 (1321)	58.0 (1473)	30.0 (762)	
008	58.0 (1473)	64.0 (1626)	34.0 (864)	
010	64.0 (1626)	70.0 (1778)	36.0 (914)	
012	66.0 (1676)	72.0 (1829)	42.0 (1067)	
014	74.0 (1880)	80.0 (2032)	42.0 (1067)	
017	80.0 (2032)	86.0 (2184)	46.0 (1168)	
021	82.0 (2083)	88.0 (2235)	52.0 (1321)	
025	86.0 (2184)	N/A	60.0 (1524)	
030	98.0 (2489)	N/A	60.0 (1524)	
035	102.0 (2591)	N/A	66.0 (1676)	
040	116.0 (2946)	N/A	68.0 (1727)	
050	120.0 (3048)	N/A	80.0 (2032)	
065	136.0 (3454)	N/A	92.0 (2337)	
080	136.0 (3454)	N/A	98.0 (2489)	
085	136.0 (3454)	N/A	104.0 (2642)	
090	136.0 (3454)	N/A	110.0 (2794)	

* These are the dimensions of the unit only. A standard base rail adds 8" (203 mm) to the width, and between 4" to 12" (102 mm to 305 mm) to the unit height. A 6" (152 mm) base rail is mandatory on unit sizes 025 to 065. An 8" (203 mm) base rail is mandatory on unit sizes 080 and larger.

Combination Cooling and Reheat Coil Section

The combination cooling and reheat coil section is available in numerous depths. This provides the option of varying the amount of space between the cooling coil and reheat coil for access to inspect and clean the coil and drain pan. All reheat and most cooling coils are arranged in a single bank, which can be 1, 2 or 3 coils high. When using a single bank of cooling coils, the 24" deep section holds up to a 4-row water or DX coil, and a 1-row or 2-row heating coil. A 36" deep section holds a 12-row water coil and a 1 or 2-row reheat coil.

Also available are staggered cooling coils. The staggered arrangement maximizes the cooling coil face area by providing two banks of coils. These two coils are not stacked, but are staggered in the direction of airflow. This configuration does require more section depth in the direction of airflow. Staggered coils are available only on unit sizes 025 and larger. The section depth required varies between 30" to 54". This depends on the unit size and number of rows in the coil.

Table 35: Combination Cooling and Reheat Coil Dimensions

Unit size	A* (large, medium coils) In. (mm)	A* (extended coils) In. (mm)	B* In. (mm)	18" – 54" In. (mm)
003	38.0 (965)	44.0 (1118)	26.0 (660)	18.0 (457) to 54.0 (1372) In 2" increments
004	40.0 (1016)	46.0 (1168)	30.0 (762)	
006	52.0 (1321)	58.0 (1473)	30.0 (762)	
008	58.0 (1473)	64.0 (1626)	34.0 (864)	
010	64.0 (1626)	70.0 (1778)	36.0 (914)

014	74.0 (1880)	80.0 (2032)	42.0 (1067)	
017	80.0 (2032)	86.0 (2184)	46.0 (1168)	
021	82.0 (2083)	88.0 (2235)	52.0 (1321)	
025	86.0 (2184)	N/A	60.0 (1524)	
030	98.0 (2489)	N/A	60.0 (1524)	
035	102.0 (2591)	N/A	66.0 (1676)	
040	116.0 (2946)	N/A	68.0 (1727)	
050	120.0 (3048)	N/A	80.0 (2032)	
065	136.0 (3454)	N/A	92.0 (2337)	
080	136.0 (3454)	N/A	98.0 (2489)	
085	136.0 (3454)	N/A	104.0 (2642)	
090	136.0 (3454)	N/A	110.0 (2794)	

* These are the dimensions of the unit only. A standard base rail adds 8" (203 mm) to the width, and between 4" to 12" (102 mm to 305 mm) to the unit height.
A 6" (152 mm) base rail is mandatory on unit sizes 025-065. An 8" (203 mm) base rail is mandatory on unit sizes 080 and larger.

When a combination coil section is used in a vertical application, a plenum must be provided on the leaving air side of the coil. The plenum is used for discharging air into the bottom of the fan section. Drain connections for units with width A greater than 108", in , are 1.50 MPT.*

Heating Coil Section

1 and 2 row heating coil section
(uncased coils)

3 and 4 row heating coil section
(cased coils)

NOTE: 1.25 MPT drain connections are available as an option for heating coil sections.

Table 36: Heating Coil Dimensions*

Unit size	A, In. (mm)	B, In. (mm)
003	38.0 (965)	26.0 (660)
004	40.0 (1016)	30.0 (762)
006	52.0 (1321)	30.0 (762)
008	58.0 (1473)	34.0 (864)
010	64.0 (1626)	36.0 (914)
012	66.0 (1676)	42.0 (1067)
014	74.0 (1880)	42.0 (1067)
017	80.0 (2032)	46.0 (1168)
021	82.0 (2083)	52.0 (1321)
025	86.0 (2184)	60.0 (1524)
030	98.0 (2489)	60.0 (1524)
035	102.0 (2591)	66.0 (1676)
040	116.0 (2946)	68.0 (1727)
050	120.0 (3048)	80.0 (2032)
065	136.0 (3454)	92.0 (2337)
080	136.0 (3454)	98.0 (2489)
085	136.0 (3454)	104.0 (2642)
090	136.0 (3454)	110.0 (2794)

* These are the dimensions of the unit only. A standard base rail adds 8" (203 mm) to the width and between 4" to 12" (102 mm to 305 mm) to the unit height.

A base rail is mandatory on unit sizes 025 to 065 and adds a minimum of 6" (152 mm) to the unit height. Unit sizes greater than 080 require a base rail that adds a minimum of 8" (203 mm to 305 mm) to the unit height.

Horizontal Discharge Two-Deck Multi-zone Coil Section

*Drain connection for units with width (A) greater than 108" are 1.50 MPT.

Table 37: Horizontal Discharge Two-Deck Multi-zone Coil Dimensions

090	136 (3454)	110 (2794)	56 (1422)	60 (1524)	62 (1575)	78 (1981)	82 (2083)	52 (3454)	29 (737)	132 (3353)	48 (1219)	122 (3099)

* Dimensions of unit only. A standard base rail adds 8" (203 mm) to width and adds between 4" to 12" (102 mm to 305 mm) to unit height. A base rail mandatory on unit sizes 025 to 065—adds a minimum of 6" (152 mm) to unit height. Unit sizes greater than 080 require a base rail, which adds a minimum of 8" (203mm) to unit height.

Economizer Section

NOTE: Dampers can be located in the top, bottom, side, opposite drive side, and end of the section.

Table 47: Economizer Dimensions

Unit size	A* In. (mm)	B* In. (mm)	C					D	G	Damper width	Damper length
			Econ. only	w/ 2" flat filter	w/ 4" flat filter	w/ 2" angle filter	w/ 4" angle filter

085	136 (3454)	104 (2642)	108 (2743)	116 (2946)	120 (3048)	152 (3861)	160 (4064)	50 (1270)	132 (3353)	46 (1168)	122 (3099)
090	136 (3454)	110 (2794)	112 (2845)	120 (3048)	124 (3150)	156 (3962)	164 (4166)	52 (1321)	132 (3353)	48 (1219)	122 (3099)

* These are the dimensions of the unit only. Curb-ready base adds 6" (152 mm) to the unit height. A standard base rail adds 8" (203 mm) to the width, and between 4" to 12" (102 mm to 305 mm) to the unit height. A base rail—mandatory on unit sizes 025 to 065—adds a minimum of 6" (152 mm) to the unit height. Unit sizes greater than 080 require a base rail that adds a minimum of 8" (203 mm) to the unit height.

Angled Economizer Section

065	136 (3454)	92 (2337)	52 (1321)	48 (1219)	82 (2083)	44 (1118)	72 (1829)
080	136 (3454)	98 (2489)	68 (1727)	60 (1524)	88 (2235)	52 (1321)	78 (1981)
085	136 (3454)	104 (2642)	68 (1727)	60 (1524)	94 (2388)	52 (1321)	84 (2134)
090	136 (3454)	110 (2794)	56 (1422)	52 (1321)	100 (2540)	48 (1219)	90 (2286)

* These are the dimensions of the unit only. Curb-ready base adds 6" (152 mm) to the unit height. A standard base rail adds 8" (203 mm) to the width, and between 4" to 12" (102 mm to 305 mm) to the unit height. A base rail—mandatory on unit sizes 025 to 065—adds a minimum of 6" (152 mm) to the unit height. Unit sizes greater than 080 require a base rail that adds a minimum of 8" (203 mm) to the unit height.

Blenders

NOTE: The depth of an air mixer section varies depending on components adjacent to the mixing device. The catalog dimensions shown are for a two-blender system except sizes 040 to 090, which are three-blender systems. For applications other than this, the depth dimension varies. Use Vision Select Tools software for more detailed dimensional information.

Table 49: Blender Product Series IV Dimensions

Unit size	A* In. (mm)	B* In. (mm)	C In. (mm)
003	38.0 (965)	26.0 (660)	N/A

Table 50: Kees Blender Dimensions

Unit size	A** In. (mm)	B* In. (mm)	C In. (mm)
003	38.0 (965)	26.0 (660)	N/A
004	40.0 (1016)	30.0 (762)	N/A
006	52.0 (1321)	30.0 (762)	22.0 (559)
008	58.0 (1473)	34.0 (864)	24.0 (610)
010	64.0 (1626)	36.0 (914)	26.0 (660)
012	66.0 (1676)	42.0 (1067)	28.0 (711)
014	74.0 (1880)	42.0 (1067)	30.0 (762)
017	80.0 (2032)	46.0 (1168)	32.0 (813)
021	82.0 (2083)	52.0 (1321)	36.0 (914)
025	86.0 (2184)	60.0 (1524)	38.0 (965)
030	98.0 (2489)	60.0 (1524)	40.0 (1016)
035	102.0 (2591)	66.0 (1676)	42.0 (1067)
040	116.0 (2946)	68.0 (1727)	38.0 (965)
050	120.0 (3048)	80.0 (2032)	42.0 (1067)
065	136.0 (3454)	92.0 (2337)	46.0 (1168)
080	136.0 (3454)	98.0 (3489)	56.0 (1422)
085	136.0 (3454)	104.0 (2642)	58.0 (1473)
090	136.0 (3454)	110.0 (2794)	58.0 (1473)

* These are the dimensions of the unit only. A standard base rail adds 8" (203 mm) to the width, and between 4" to 12" (102 mm to 305 mm) to the unit height.

** All values represent Kees blenders located after filters.

A 6" (152 mm) base rail is mandatory on unit sizes 025 to 065. An 8" (203 mm) base rail is mandatory on all sizes 080 and larger.

Access Doors

Access doors are an option for most sections. Fan sections are always provided with a door on one side of the unit. Access door size varies with the size of the section; they are never wider than 30". On most components doors can be selected as inward opening. Once the door is opened outward, the opening is 2" less than the door height and width because there is a 1" flange around the opening. Once the door is opened inward, the opening is 3" less than the door height and width since there is no flange around the opening. Door height is always 4" shorter than section height unless the section has a drain connection. If the section has a drain pan, then the door is 6" shorter than the section height. The maximum door height is 64", except filter section doors, which are equal to section height minus 4".

Table 51: Access Door Dimensions

Unit cross section			
Unit size	A, In. (mm)	B*, In. (mm)	E, In. (mm)
003	38.0 (965)	26.0 (660)	20 (508)
004	40.0 (1016)	30.0 (762)	24 (609.6)

42.0 (1067)	30.0 (762)
44.0 (1118)	30.0 (762)
46.0 (1168)	30.0 (762)
48.0 (1219)	30.0 (762)
50.0 (1270)	30.0 (762)
52.0 (1321)	30.0 (762)
54.0 (1372)	30.0 (762)

* Filter access doors are the "B" dimension minus 6".

A standard base rail adds 8" (203 mm) to width and between 4" to 12" (102 mm to 305 mm) to unit height.

A 6" (152 mm) base rail is mandatory on unit sizes 025 to 065.

An 8" (203 mm) base rail is mandatory on all sizes 080 and larger.

Diffuser

Table 53: Diffuser Dimensions

Unit	A* In. (mm)	B* In. (mm)	C, In. (mm)
			Housed fans
003	38.0 (965)	26.0 (660)	10.0 (254)
004	40.0 (1016)	30.0 (762)	10.0 (254)
006	52.0 (1321)	30.0 (762)	10.0 (254)
008	58.0 (1473)	34.0 (864)	12.0 (305)

090**	136.0 (3454)	110.0 (2794)	12.0 (305)	58.0 (1473)	44.0 (1118)

* These are the dimensions of the unit only. A standard base rail adds 8" (203 mm) to the width, and between 4" to 12" (102 mm to 305 mm) to the unit height.

A 6" (152 mm) base rail is mandatory on unit sizes 025-065. An 8" (203 mm) base rail is mandatory on all sizes 080 and larger.

** Right angle face and bypass dampers are mandatory on unit sizes 040 and larger.

Discharge or Return Plenum

Return and discharge plenums are available with openings in the top, bottom, upper end, lower end, drive side, or opposite drive side. The opening size does not vary with the location. All openings have a 1" flange recessed in opening. 1.25 MPT drain connection available as an option for plenum sections.

Table 56: Discharge or Return Plenum Dimensions

Unit size	A* In. (mm)	B* In. (mm)	C In. (mm)	D In. (mm)	E In. (mm)

025	86.0 (2184)	60.0 (1524)	—
030	98.0 (2489)	60.0 (1524)	—
035	102.0 (2591)	66.0 (1676)	—
040	116.0 (2946)	68.0 (1727)	—
050	120.0 (3048)	80.0 (2032)	—
065	136.0 (3454)	92.0 (2337)	—
080	136.0 (3454)	98.0 (3489)	—
085	136.0 (3454)	104.0 (2642)	—
090	136.0 (3454)	110.0 (2794)	—

* These are the dimensions of the unit only. A standard base rail adds 8" (203 mm) to the width, and between 4" to 12" (102 mm to 305 mm) to the unit height.

A 6" (152 mm) base rail is mandatory on unit sizes 025 to 065. An 8" (203 mm) base rail is mandatory on all sizes 080 and larger.

** 40.00", 52.00" and 64.00" actuator section lengths available for all unit sizes.

Base Rail

NOTE: The base rail is available in heights of 4", 6", 8", 10", and 12".

Electrical Data

Supply Power Wiring

1. Units required three phase power supply.
2. Allowable voltage tolerances:
 - a. 60 Hertz
 Nameplate 208 V: Min. 187 V, max. 229 V
 Nameplate 230 V: Min. 207 V, max. 253 V
 Nameplate 460 V: Min. 414 V, max. 506 V
 Nameplate 575 V: Min. 518 V, max. 633 V
3. **Minimum Circuit Ampacity (MCA) calculation:**
Note: If a unit is provided with multiple power connections, each must be considered alone in selecting power wiring components.
 For units with cooling and heating:

$$MCA = 1.25 \times \text{largest load} + \text{sum of all other loads}$$
Note: Control circuit ampacity does not need to be considered in the calculation for wire sizing ampacity.
 If the unit is provided with one or more fan section lights, they are powered from the separate 15 amp (minimum), 120 V supply required by the NEC for the unit convenience outlet.
4. Size wires in accordance with Table 310-16 or 310-19 of the [National Electrical Code](#).
5. Wires should be sized for a maximum of 3% voltage drop.

Table 58: Recommended Power Wiring

Ampacity	No. of power wires per Phase	Wire gauge	Insulation rating (0°C)
30	1	10	75
40	1	8	75
55	1	6	75
70	1	4	75
85	1	3	75

1.03 SUBMITTALS

- A. Shop Drawings: Indicate assembly, unit dimensions, weight loading, required clearances, construction details, field connection details, and electrical characteristics and connection requirements. Computer generated fan curves for each air handling unit shall be submitted with specific design operating point noted. A computer generated psychometric chart shall be submitted for each cooling coil with design points and final operating point clearly noted. Sound data for discharge, radiated and return positions shall be submitted by octave band for each unit. Calculations for required baserail heights to satisfy condensate trapping requirements of cooling coil shall be included.
- B. Product Data:
 - 1. Provide literature that indicates dimensions, weights, capacities, ratings, fan performance, and electrical characteristics and connection requirements.
 - 2. Provide data of filter media, filter performance data, filter assembly, and filter frames.
- C. Manufacturer's Installation Instructions.

1.04 QUALIFICATIONS

- A. Manufacturers specializing in manufacturing Air Handling Units specified in this section must prove minimum five years documented experience and issue a complete catalog on total product.

1.05 SAFETY AGENCY LISTED & CERTIFICATION

- A. Air handling units shall be cETLus safety listed that conforms to UL Standard 1995 and CAN/CSA Standard C22.2 No. 236. Units shall be accepted for use in New York City by the Department of Building, MEA 342-99-E.
- B. Air handler furnished with double width, double inlet (DWDI) and/or plenum fans shall be certified in accordance with the central station air handling units certification program, which is based on AHRI 430. (NOTE: Above does not apply to fan array)
- C. Air handling unit water heating & cooling coils shall be certified in accordance with the forced circulation air cooling and air heating coils certification program, which is based on AHRI Standard 410.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver, store, protect and handle products to site.
- B. Accept products on site in factory-fabricated protective containers, with factory-installed shipping skids. Inspect for damage.
- C. Store in clean dry place and protect from weather and construction traffic. Handle carefully to avoid damage to components, enclosures, and finish.

PART 2: PRODUCTS

2.01 MANUFACTURERS

- A. The following manufacturers are approved for use. No substitutions will be permitted.
1. Daikin Applied as basis of design
 2. Miller-Picking
 3. Temtrol
 4. Scott-Springfield
 5. Racan-Carrier Company

2.02 GENERAL DESCRIPTION

- A. Configuration: Fabricate as detailed on drawings.
- B. Performance: Conform to AHRI 430. See schedules on prints. (NOTE: Above does not apply to fan array)
- C. Acoustics: Sound power levels (dB) for the unit shall not exceed the following specified levels. The manufacturer shall provide the necessary sound treatment to meet these levels if required.

Octave Band at Center Frequency (Hz)								
	63	125	250	500	1000	2000	4000	8000
Radiated								
Discharge								
Return								

D. [IBC Certification

1. All components included herein are designed, manufactured and independently tested, rated and certified to meet the seismic compliance standards of the 2009 International Building Code. Components designated for use in systems that are life safety, toxic, high hazard, combustible or flammable shall meet the on line, anchorage and load path requirements for life safety as defined in IBC sections 1621.1.6, 1621.3.3, 1707.7.2, and IBC Commentary, Volume II, section 1621.1.6, IBC notes pertaining to the release of hazardous material. All components used as part of a system other than the above shall meet as a minimum, all load path and anchorage standards for components as outlined in IBC section 1621.3.3 & 1707.7.2.
2. Certification is good for [Fp/Wp = 2.89 gs and Sds = 1.29 gs obtained from a "maximum considered earth quake short period spectral response acceleration Ss of 1.93.] [Fp/Wp = 4.42 gs and Sds = 1.96 gs obtained from a "maximum considered earth quake short period spectral response acceleration Ss of 2.94.]
3. All completed component assemblies shall be clearly labelled for field inspection. Seismic Compliance Labels shall include the manufacturer's identification, designation of certified models, definitive information describing the product's compliance characteristics, and the Independent Certifying Agency's name and report identification.

4. In addition to all seismic requirements for IBC Certification listed elsewhere in the project specification, manufacturer's submittals shall include.
5. Certificate of Compliance from the Independent Certifying Agency clearly indicating that components supplied on this project are included in the component manufacturer's Certificate of Compliance.
6. Clear installation instructions including all accessory components that are part of the overall component installation.]

2.03 UNIT CONSTRUCTION

- A. Fabricate unit with 16 gauge channel posts and panels secured with mechanical fasteners. All panels, access doors, and ship sections shall be sealed with permanently applied bulb-type gasket. Shipped loose gasketing is not allowed.
1. Panels and access doors shall be constructed as a 2-inch (50-mm) nominal thick; thermal broke double wall assembly, injected with foam insulation for an R-value of not less than R-13. The outer panel shall be constructed of G90 galvanized [G60 painted galvanized] [18-gauge] steel. The inner liner shall be constructed of G90 galvanized [solid stainless] steel.
 2. Panel deflection shall not exceed L/240 ratio at 125% of design static pressure, maximum positive or negative 8 inches of static pressure. Deflection shall be measured at the midpoint of the panel height.
 3. Panel assembly shall meet UL standard 1995 for fire safety. Panel assembly shall comply with the material requirements of NFPA 90A.
 4. The casing leakage rate shall not exceed [0.50 cfm per square foot of casing surface area at design static pressure up to a maximum of +5" w.c. in positive pressure sections and -6" w.c. in negative pressure sections (.0025 m3/s per square meter of cabinet area at 1.24 kPa static pressure) for standard cabinet units.] [ASHRAE 111 Class 6 at design static pressure up to a maximum of +8" w.c. in positive pressure sections and -8" w.c. (1.99 kPa) in negative pressure sections, where casing leakage (cfm/100 ft2 of casing surface area) = CL x P0.65 for high pressure cabinet units] [1% of supply air volume at design static pressure up to a maximum of +8" w.c. in positive pressure sections and -8" w.c. (1.99 kPa) in negative pressure sections for high pressure cabinet units].
 5. Module to module assembly shall be accomplished with an overlapping, full perimeter, internal splice joint sealed with bulb type gasketing on both mating modules to minimize on-site labor and meet indoor air quality standards.

6. Factory leakage test available for units selected with high pressure, low leakage construction. The unit manufacturer shall provide a witnessed factory leak test on selected units. The cabinet shall be tested at the unit's positive and negative maximum design operating static pressure, [up to 8" of differential static pressure across the cabinet exterior walls for the entire unit. Cabinet leakage shall not exceed Class 6 leakage per ASHRAE Standard 111 or 1% of supply air volume, whichever is greater] [up to +5"/-6" of differential static pressure across the cabinet exterior walls for the entire unit. Cabinet leakage shall not exceed 0.50 CFM/sq. ft. of casing surface area]. All supply and return opening shall be sealed. Air pressure and flow shall be measured by a third party calibrated and certified apparatus. The testing shall be performed at the factory. Owner's representative shall select on unit to be tested at the time of order. A written test report shall be prepared by the manufacturer and issued to the owner's representative.
7. Factory panel deflection testing available for units selected with high pressure, low leakage construction. The unit manufacturer shall provide a factory deflection test on one unit at the unit's positive and negative maximum design operating static pressure, up to 8" of differential static pressure across the cabinet exterior walls for the entire unit. A deflection limit of L/240 will be demonstrated at this time. "L" is defined as the height of a panel on the side of the unit. Measurement shall be at the mid-point of "L" along the largest panel on one side. Owner's representative shall select on unit to be tested at the time of order. A written test report shall be prepared by the manufacturer and issued to the owner's representative.
8. [A sound baffle shall be secured to the inner liner and constructed of G60 galvanized perforated steel filled with fiberglass insulation.]
9. [An optional 0.044" thick aluminium treadplate shall be secured to the floor panel.]
10. [Entire unit shall have a [4] [6] [8] [10] [12]-inch full perimeter base rail for structural rigidity and condensate trapping. The following calculation shall determine the required height of the baserail to allow for adequate drainage. Use the largest pressure to determine base rail height. [(Negative)(Positive) static pressure (in)] (2) + 4" = required baserail height. Should the unit baserail not be factory supplied at this height, the contractor is required to supply a concrete housekeeping pad to make up the difference.]
- B. Access Doors shall be flush mounted to cabinetry, with minimum of two six inch long stainless steel piano-type hinges, latch and full size (4.5" minimum) handle assembly (provide inspection window for fan section). Door shall swing outward for unit sections under negative pressure (inward for unit sections under positive pressure). Doors limited from swinging inward (such as side access filter sections) on positive pressure sections, shall have a secondary latch to relieve pressure and prevent injury upon access.
- C. Construct drain pans from stainless steel with cross break and double sloping pitch to drain connection. Provide drain pans under cooling coil section [fan section]. Drain connection centerline shall be a minimum of 3" above the base rail to aid in proper condensate trapping. Drain connections that protrude from the base rail are not acceptable. There must be a full 2" thickness of insulation under drain pan.

2.04 SUPPLY / RETURN FANS

- A. Provide [DWDI forward-curved] [DWDI airfoil] [belt-drive airfoil plenum] [direct-drive airfoil plenum] [DWDI forward curved twin] [fan array] supply [return] fan(s). Fan assemblies including fan, motor and sheaves shall be dynamically balanced by the manufacturer on all three planes and at all bearing supports. Manufacturer must ensure maximum fan RPM is below the first critical speed.

ECM fan array

1. Provide ECM, motorized impeller supply [return] fan(s). Fan assembly shall include fan, fan base, and a motor and shall be dynamically balanced by the fan manufacturer.
 - a. Inverter shall be integral to the motor and come as an assembly from the fan manufacturer.
 - b. Motor shall be brushless DC type with a permanent magnet rotor.
 - c. Fan section shall come equipped with a motor control panel mounted on the supply [return] fan section. Both line voltage and low voltage wiring shall be done by the factory. Each fan shall have an isolation switch.
 - d. [Unit shall be provided with a ship loose motor control panel for the supply [return] fan section. All motor wiring shall be field supplied and installed]
 - e. Motor control panel shall come equipped with a fused disconnect
 - f. Motor control panel shall come with a low voltage terminal strip and shall include terminals for Fan ON/OFF, 0-10V signal, and fan fault.
 - g. ECM motor control panel SCCR shall be at least 65kA
 - h. [Unit shall come equipped with an isolation damper upstream of each fan in the array. Damper shall be equipped with an adjustable,

weighted counter balance to minimize static pressure loss]

- i. [The control box shall be UL or ETL listed. DDC controller shall be BACnet compatible. Controller shall be configurable for fan speed control via HMI, BACnet interface (MS/TP), 0-10 VDC input, 4-20 mA input, constant airflow, or duct static pressure (static pressure sensor to be field-provided and mounted). Controller shall be capable of monitoring the array's airflow, total static pressure, power consumption, RPM, individual fan alarm status, and specific cause of alarm. Control panel shall be equipped with relays for locking between other electrically driven components. A system alarm contact shall be provided to provide status feedback. A system enable contact shall be provided to enable/disable the fans.]

DDPL fan array

1. Fan array shall have number of fans as scheduled.
2. Fan array section shall come with sound absorbing panels installed around each fan.
3. Fan array shall have fans individually isolated with [Rubber in Shear(RIS)][spring] isolation.
4. Access section placed downstream for motor access. [Section shall come installed with tread plate installed in the floor. [Section shall come with motor removal hoist installed]
5. [Unit shall be equipped with a manual block-off plate for mounting in the fan inlet][Unit shall come equipped with an isolation damper upstream of each fan in the array. Damper shall be equipped with an adjustable, weighted counter balance to minimize static pressure loss][Unit shall come equipped with an actuated damper upstream of each fan. An external signal shall close the damper in the event of a fan failure.]
6. [Fan array section shall come with an externally mounted junction box to allow for field wiring of the fan array motors]
7. [Fan section shall come equipped with motor control panel with short circuit protection complete with variable frequency drives.]
 - a. [Fan array shall be equipped with one variable frequency drive wired to all fans][Fan array shall have a redundant drive wired to all fans]
 - b. [Fan array shall be equipped with one variable frequency drive wired to all fans in a given row in the fan array.]
 - c. [Fan array shall be equipped with on variable frequency drive wired to each of the fans in the fan array]
8. [Motor control panel shall come equipped with a [fused][non-fused] disconnect switch]
9. [Fan array shall be equipped with Piezometer rings to measure airflow][One piexometer ring shall be supplied on [each fan][each row][one fan] in the fan array]

Multiple direct-drive fans

1. Unit shall have [two] [three] [9] [12] blade direct-drive class II fans with [2" spring isolation] [rubber-in-shear isolation (fan sizes 36 and smaller)] [2" seismic isolation].
2. [Manual block-off] [isolation damper [with actuator]] mounted upstream of fan for isolation of individual fans.
3. [Single source power motor control panel with short circuit protection and [Non-fused disconnect] [fused disconnect] [Circuit breaker] factory wired from panel to motors in conduit. Variable speed control by [McQuay brand VFD(s)] [ABB] [Danfoss].] [Fan on-off and speed control by others shall be provided.]

Q-PAC fan array

1. The fan array will be arranged with high performance direct drive, single inlet, plenum fans with backwards inclined, high efficiency welded-aluminum or high-performance composite impeller with galvanized or aluminum support frame.
2. Manual blank-off plates shall be provided to block fan airflow, one plate to be provided per array. [Optional Backdraft dampers shall be provided to block fan airflow in lieu of blank-off plates.]
3. The fans are driven by long-life, low-temperature brushless DC electronically commutated motor (EC-Motor) with external rotor and integrated maintenance-free electronic circuitry and electronics. The motor is manufactured with maintenance-free, permanently lubricated ball bearings and shall be statically and dynamically balanced in accordance with ISO 1940 part 1. The motor shall be closed, protection level IP 54, thermal class 155 with permissible operating temperature of -13°F to 140°F. Motor efficiency class shall comply with IE4. Fan characteristic curves indicate measurements on a chamber test in accordance with ISO5801. The three-phase external rotor motor integrated into the fan hub meets the requirements for circulating electric machines set forth in DIN EN 60 034-1 (VDE 0530 Part 1).
 - a. Fan Array shall be listed per UL 1995.
 - b. Fan assemblies shall be prewired with wire whips and plug connectors.
 - c. Fan system manufacturer must stock replacement parts in North America.
4. The fan bulkhead wall shall be constructed in a manner for easy field assembly, constructed of 14 gauge G90 formed sheet metal. The bend profile at each panel's seam shall provide vertical structural support for the bulkhead wall.
5. The control panel shall include an external disconnect and shall be UL or ETL listed. [Each panel contains a lockable Hand/Off/ Auto switch for optional manual speed control. The panel accepts a 0-10VDC signal when in Auto mode and can be controlled locally when in Hand Mode.] [The panel shall be provided with a BACnet compatible controller capable

of monitoring the array's airflow, total static pressure, power consumption, RPM, and individual fan alarm status and specific cause of alarm. Controller shall be configurable for fan speed control via BACnet interface (MS/TP), 0-10 VDC input, 4-20 mA input, constant airflow, or duct static pressure (static pressure sensor to be field provided and mounted). Control panel shall be equipped with relays for locking between other electrically driven components.]

6. There is a system alarm contact that the BAS can use to check the status of the Q-PAC System. There is a system enable contact that the BAS can use to enable or disable the Q-PAC System, along with a safety circuit terminations.
7. All Q-PAC components shall be sized to fit through a 20" x 40" access opening.
- B. Bearings shall be self-aligning, grease lubricated, ball or roller bearings with extended copper lubrication lines to access side of unit. Grease fittings shall be attached to the fan base assembly near access door. If not supplied at the factory, contractor shall mount copper lube lines in the field.
- C. Fan and motor shall be mounted internally on a steel base. Factory mount motor on slide base that can be slid out the side of unit if removal is required. Provide access to motor, drive, and bearings through hinged access door. Fan and motor assembly shall be mounted on [rubber-in-shear vibration type isolators inside cabinetry.] [2" deflection spring vibration type isolators inside cabinetry] [unit base, rigid mounted.] [Seismic snubbers shall be provided.]

2.05 BEARINGS AND DRIVES

(Not applicable for fan array or direct-drive fans)

- A. Bearings: Basic load rating computed in accordance with AFBMA - ANSI Standards, [L-50 life at 200,000 hours – all DWDI fans] [L-50 life at 500,000 hours – DWDI fans on unit sizes 003 - 035], [L-50 life at 400,000 hours all belt-drive airfoil plenum fans and DWDI fans on unit sizes greater than 035] [L-50 life 1,000,000 hours – DWDI fans on unit sizes 003 – 035], heavy duty pillow block type, self-aligning, grease-lubricated ball bearings.
- B. Shafts shall be solid, hot rolled steel, ground and polished, keyed to shaft, and protectively coated with lubricating oil. Hollow shafts are not acceptable.
- C. V-Belt-drives shall be cast iron or steel sheaves, dynamically balanced, bored to fit shafts and keyed. [Fixed sheaves, matched belts, and drive rated based on motor horsepower] [Variable and adjustable pitch sheaves selected so required RPM is obtained with sheaves set at mid-position and rated based on motor horsepower. Contractor to furnish fixed sheaves at final RPM as determined by balancing contractor]. Minimum of 2 belts shall be provided on all fans with 10 HP motors and above. Standard drive service factor shall be [1.1 S.F. (for 1/4 HP – 7.5 HP)] [1.3 S.F. (for 10HP and larger)], calculated based on fan brake horsepower.

2.06 ELECTRICAL

- A. The air handler(s) shall be ETL and ETL-Canada listed by Intertek Testing Services, Inc. Units shall conform to bi-national standard ANSI/UL Standard 1995/CSA Standard C22.2 No. 236.
- B. Wiring Termination: Provide terminal lugs to match branch circuit conductor quantities, sizes, and materials indicated. Enclosed terminal lugs in terminal box sized to NFPA 70.
- C. [Provide [marine light] [marine light and GFI receptacle] in [fan] [each] section mounted and wired to a junction box and on-off switch mounted on the outside of the cabinet.
- D. Fan motors shall be [1200] [1800] [3600] rpm, [open drip-proof (ODP)] [totally enclosed fan-cooled (TEFC)] [1800/ 1200 rpm, 2 Speed/2 Winding (ODP) (TEFC)] [1800/900 rpm, 2 Speed/1 Winding (ODP) (TEFC)] type. Motors shall be [standard efficiency.] [high efficiency to meet EPA requirements.] [premium efficiency.] Electrical characteristics shall be as shown in schedule.
- E. [Air handler manufacturer shall provide and mount conduit and wiring from each fan motor terminated at [an external junction box.] [a non-fused] [a fused] [a circuit breaker] type disconnect switch factory wired. The disconnect switch shall be furnished with a rotary or switch-blade type handle that can be padlocked in the 'off' position.] [A motor starter [IEC] [NEMA] type shall be provided.]
- F. [Air handler manufacturer shall provide and mount [Daikin Applied] [ABB] [Danfoss] variable speed drive with electrical characteristics as shown on project schedule. [A two-contactor type bypass switch shall be provided.] [A line reactor shall be provided.]
- G. Air handler manufacturer shall provide and mount a handoff-auto (HOA) switch.]
- H. [Air handler manufacturer shall provide and mount a [24V] [120V] transformer.]
 - I. [Manufacturer must provide ASHRAE 90.1 Energy Efficiency equation details for individual equipment to assist Building Engineer for calculating system compliance.]
 - J. [Ultraviolet Light Germicidal Irradiation (UVGI) System
 1. The UVGI surface irradiation system shall consist of heavy duty, factory assembled and tested light fixtures that emit short wave UVC light (200 nm – 270 nm)
 2. Constructed and tested for HVAC environments: UL listed at 55°F to 135°F with airflow velocities up to 1000 FPM. Independently tested to verify output and performance. UVGI system shall have UL Approval per Category Code ABQK (Accessories, Air Duct Mounted) UL Standards: UL153, UL1598 & UL1995.
 3. Assembly shall consist of double ended UVC florescent lamp and housing, power source and sockets shall be UL Drip proof construction.
 4. The enclosure shall be made of drip-proof

construction from galvanized steel. The ballast shall be a self-contained electronic type. The enclosure shall include safety mechanical interlocks which do not allow the UV assembly to light unless installed on its track. The multiple UV assemblies shall connect via interlock.

5. UVC Lamp shall be a standard output hot cathode, low pressure T8, double ended UVC lamp. Lamps shall be constructed with a thick wall glass of soda barium UV transparent glass with a base of metal. Lamps shall have 5.5 milligrams or less of mercury.
6. Lamps shall produce adequate UV output and operate in environments of temperatures between 55°F to 135°F. Lamps shall produce a minimum of 80% of initial UV output at end of life (9000 hours minimum).
7. Power source shall be 120 VAC 60hz. Power connections shall be via a provided j-box or line cord from one end of the UV fixture. UV fixtures shall electrically connect via interlocks.
8. Installation shall be such that the cumulative sum length of UV fixtures end-to-end shall equal the coil width +/- three (3) inches. Modular coil system shall be installed and wired so that the entire surface of the coil and drain pan is bathed by UVC. System shall be installed using "tracks" to allow UV fixture to slide into place, for ease of access during installation and annual maintenance. System shall be installed 8"-20" (14" ideal) from coil surface. System shall be installed utilizing one row of lamps for every 48" of coil height. System shall incorporate safety "cut-off" switches on access doors.
9. Approved manufacturers: UltraViolet Devices, Inc. (UVDI).

2.07 COOLING AND HEATING COIL SECTIONS

- A. Provide access to coils from [both sides] [connection side] [opposite side] of unit for service and cleaning. Enclose coil headers and return bends fully within unit casing. Unit shall be provided with coil connections that extend a minimum of 5" beyond unit casing for ease of installation. Drain and vent connections shall be provided exterior to unit casing. Coil connections must be factory sealed with grommets on interior and exterior and gasket sleeve between outer wall and liner where each pipe extends through the unit casing to minimize air leakage and condensation inside panel assembly. If not factory packaged, Contractor must supply all coil connection grommets and sleeves. Coils shall be removable through side and/or top panels of unit without the need to remove and disassemble the entire section from the unit.
 1. Identify fin, tube & casing material type and thickness.
 2. Show coil weights (shipping & operating).
 3. State air and fluid flow amounts with its associated pressure drops. For steam coils, indicate steam pressure and condensate load.
4. Indicate entering & leaving air and water temperatures. For refrigerant coils, indicate saturated suction temperature (SST).
5. [Manufacturer to provide and mount ultraviolet lights on the leaving air side of the cooling coil(s) and over the drain pan to meet GSA 2003 Facilities Standard - 5.9 HVAC Systems and Components and agency approved to UL category Code ABQK specification, HVAC Accessories, Air Duct Mounted.]
- B. Water Coils:
 1. Certification - Acceptable water coils are to be certified in accordance with AHRI Standard 410 and bear the AHRI label. Coils exceeding the scope of the manufacturer's certification and/or the range of AHRI's standard rating conditions will be considered provided the manufacturer is a current member of the AHRI Air-Cooling and Air-Heating Coils certification programs and that the coils have been rated in accordance with AHRI Standard 410. Manufacturer must be ISO 9002 certified.
 2. Headers shall consist of seamless copper tubing to assure compatibility with primary surface. Headers to have intruded tube holes to provide maximum brazing surface for tube to header joint, strength, and inherent flexibility. Header diameter should vary with fluid flow requirements.
 3. Fins shall have a minimum thickness of [[0.0075"] [0.0095"] of aluminum] or [0.006"] [0.0075"] [0.0095"] copper]] plate construction. Fins shall have full drawn collars to provide a continuous surface cover over the entire tube for maximum heat transfer. Tubes shall be mechanically expanded into the fins to provide a continuous primary to secondary compression bond over the entire finned length for maximum heat transfer rates. Bare copper tubes shall not be visible between fins.
 4. Coil tubes shall be 5/8 inch (16mm) OD seamless copper, 0.020" [0.025"] [0.035"] [0.049"] nominal tube wall thickness, expanded into fins, brazed at joints. Soldered U-bends shall be provided to minimize the effects of erosion and premature failure having a minimum tube wall thickness of 0.025".
 5. Coil connections shall be [N.P.T. threaded carbon steel] [butt weld carbon steel] [O.D. sweat copper] [threaded red brass] with connection size to be determined by manufacturer based upon the most efficient coil circuiting. Vent and drain fittings shall be furnished on the connections, exterior to the air handler. Vent connections provided at the highest point to assure proper venting. Drain connections shall be provided at the lowest point to ensure complete drainage and prevent freeze-up.
 6. Coil casings shall be a formed channel frame of [galvanized steel] [stainless steel]. Water heating coils, 1 & 2 row only (sans 5M type) shall be furnished as uncased to allow for thermal movement and slide into a pitched track for fluid drainage.

C. Refrigerant Coils:

1. Manufacturer must be ISO 9002 certified.
2. Coils designed for use with Refrigerant [R-22] [R134a] [R410a] [other]. Fins shall have a minimum thickness of [[0.0075"] [0.0095"] of aluminum] or [0.006"] [0.0075"] [0.0095"] copper]] plate construction with full drawn collars to provide a continuous surface cover over the entire tube for maximum heat transfer. Tubes shall be mechanically expanded into the fins to provide a continuous primary-to-secondary compression bond over the entire finned length for maximum heat transfer rates. Bare copper tube shall not be visible between fins.
3. Refrigerant coils shall be provided with round seamless 5/8" O.D. copper tubes on 1-1/2" centers, staggered in the direction of airflow. All joints shall be brazed.
4. Sweat type copper suction connections located at the bottom of the suction headers for gravity oil drainage. Coils shall be uniformly circuited in a counterflow manner for [single circuit] [row] [face] [interlaced] [interlaced face split] capacity reduction. Pressure type liquid distributors used. Coils shall be tested with 315 pounds air pressure under warm water, and suitable for 250 psig working pressure.

D. Steam Coils:

1. Certification - Acceptable steam coils are to be certified in accordance with AHRI Standard 410 and bear the AHRI label. Coils exceeding the scope of the manufacturer's certification and/or the range of AHRI's standard rating conditions will be considered provided the manufacturer is a current member of the AHRI Air-Cooling and Air-Heating Coils certification programs and that the coils have been rated in accordance with AHRI Standard 410. Manufacturer must be ISO 9002 certified.
2. Fins shall have a minimum thickness of [[0.0075"] [0.0095"] [0.012" (1" dia. tubes only)] of aluminum] or [0.006" (5/8" tube dia. only)] [0.0075"] [0.0095"] copper]] with full drawn collars to provide a continuous surface cover over the entire tube for maximum heat transfer. Tubes shall be mechanically expanded into the fins to provide a continuous primary-to-secondary compression bond over the entire finned length for maximum heat transfer rates. Bare copper tubes shall not be visible between fins.
3. Steam coils shall be provided with round seamless [5/8" O.D. copper [0.020"] [0.025"] [0.035"] [0.049"] or [1" O.D. copper [0.025"] [0.049"] tubes. Tubes on two-row coils are staggered in the direction of airflow. All joints shall be brazed.
4. Steam coil headers shall be made of nonferrous materials using seamless copper tubing with intruded tube holes to permit expansion and contraction without creating undue stress or strain. Both the supply and return headers shall be completely encased by the coil casing. Coil

shall be pitched in the unit to assure positive condensate drainage. Steam coils shall be furnished as uncased to allow for thermal movement and slide into a pitched track for drainage. Orificed baffle plates shall be installed in the supply connection to ensure proper diffusion of entering steam.

5. Steam coils shall be tested with 315 pounds air pressure under warm water and suitable for 150 psig working pressures.

E. [Horizontal Tube Integral Face and Bypass Coil

1. Horizontal tube integral face and bypass coils shall consist of multiple alternating heating sections and bypass sections, with airflow distributed to each by interlocking wrap-a-round "clamshell" style dampers; linkage to be stainless steel. Coils shall be suitable for hot water or steam and continuous operation at 200 psig and 400 F degrees. Heating elements to consist of multi-row, multi-pass extended heat transfer surface; coil shall carry AHRI 410 certification as to ratings. Welding and brazing shall be done by ASME qualified personnel.
2. Tubes shall be 5/8" diameter seamless copper, 0.035" average wall thickness. Fins shall be continuous patterned plate, 0.0075" thick aluminum with full fin collars. Joints shall be silver brazed.
3. Headers shall be single piece carbon steel, with no separate disks or caps welded or brazed into header ends. Connections shall be steel and shall be welded to header barrels.
4. Casings and dampers shall be minimum 16 gauge mill galvanized steel; top and bottom casing panels to be double flanged for stacking. End casings shall have smooth, embossed tube holes to provide adequate bearing surface for tubes to avoid abrasion during expansion and contraction. Flexible connectors shall not be required.]

F. [Vertical Tube Integral Face and Bypass Coil

1. Vertical tube integral face and bypass coils shall consist of multiple alternating heating sections and bypass sections, with airflow distributed to each by interlocking wrap-a-round "clamshell" style dampers; linkage to be stainless steel. Coils shall be suitable for hot water or steam and continuous operation at 200 psig and 400 F degrees. Heating elements to consist of multi-row, multi-pass extended heat transfer surface; coil shall carry AHRI 410 certification as to ratings. Welding and brazing shall be done by ASME qualified personnel.
2. Hot water applications shall be furnished with 5/8" outside diameter tubes with .035" tube wall thickness. Steam applications shall be furnished with a non-freeze, tube-within-a-tube design that consists of an outer tube that is 5/8" outside diameter tubes with 0.035" tube wall thickness and an inner tube that is 3/8" outside diameter with 0.020" wall thickness. Fins shall be a helical fin design that is 1/2" high, 0.012" thick copper,

solder coated.

3. Supply and Return headers shall be located at the base of the coil. Hot water coils shall employ return bends. Steam coils shall be capped to allow free thermal movement. Headers shall be carbon steel with male pipe thread connections.
4. The casing shall be 12 gauge galvanized steel. The dampers shall be 16 gauge galvanized steel with aluminum hinges, stainless steel pins, linkage & connecting bars with oilite bearings.]

2.08 GAS HEAT MODULE

- A. The air handling unit shall include a natural gas heating section. The gas duct furnace shall be natural gas fired heating module(s) factory installed downstream of the supply air fan in the heat section.
- B. [The heating module shall be a tubular design with in-shot gas burners. The heat exchanger tubes shall be constructed of stainless steel. The module shall have an induced draft fan that will maintain a negative pressure in the heat exchanger tubes for the removal of the flue gases.] [High efficiency heat exchanger shall be a primary drum and multi-pass tubular secondary constructed of titanium stainless steel, and shall be of a floating design to minimize stresses during heating and cooling cycles. Tubing used for the heat exchanger shall comply with ASTM A268 or ASTM 249 (as applicable). Secondary tubes shall be swaged into panels and welded to provide a secure joint and air tight assembly. All heat transfer surfaces shall be inside the casing and in the air stream.]
- C. [Gas-fired duct furnaces provided shall have a tubular heat exchanger constructed of (Type 409 Stainless Steel .044 minimum wall thickness produced to ASTM A268).]
- D. [Duct furnace to provide a minimum combustion efficiency of 90% through the entire firing range, exceeding the ASHRAE 90.1 minimum requirement for steady state efficiency.]
- E. [High efficiency gas heat section shall be provided with condensate drain(s). Installer is responsible for materials and final connection of drain(s) for condensate disposal.]
- F. [High efficiency duct furnaces require a Category IV venting system certified to UL 1738 / ULC S636. Installer is responsible for material and final vent installation in accordance with manufactures instructions provided.]
- G. The Duct Furnace models shall be listed by Intertek Testing Services (ITS / ETL) for operation on Natural or Propane gas to the current edition of ANSI Z83.8 Standard for Gas-Fired Duct Furnaces. Duct furnaces are for installation on the positive pressure side of the circulating air blower, only.
- H. [Gas Module shall be [2] [4] stages of control] [Gas module shall have [5:1] [10:1] [20:1] [25:1] modulating control.]
- I. Each burner module shall have [two flame roll-out safety protection switches and] a high temperature limit switch that will shut the gas valve off upon

detection of improper burner manifold operation.

- J. The induced draft fan shall have an airflow safety switch that will prevent the heating module from turning on in the event of no airflow in the flue chamber.
- K. Field installed heating modules shall require a field ETL certification. The manufacturer's rooftop unit ETL certification shall cover the complete unit including the gas heating modules.
- L. Individual Duct Furnaces shall incorporate a Direct Spark Ignition control module that is design certified by a recognized national testing agency. The control shall provide:
 1. 100% safety shut-off
 2. A 15 second minimum pre-purge period prior to trial for ignition
 3. High energy direct spark ignition of main burners
 4. Electronic flame supervision incorporating a 0.8 second flame failure response time
 5. Up to 2 additional ignition retrials preceded by an interpurge period
 6. A minimum 30 second post-purge
 7. Automatic reset after one hour to initiate additional ignition trials if lockout occurs during heat call
 8. An LED indicator light to provide a flash code to identify the operating condition of the control

2.09 PARTICULATE FILTERS

- A. [Filter section with filter racks and guides with hinged and latching access doors on either, or both sides, for side loading and removal of filters] [Filter section with front loading frames and clips].
- B. Filter media shall be UL 900 listed, Class I or Class II.
- C. [Flat] [Angle] arrangement with [2", 50mm] [4", 100mm] deep [pleated] [disposable] panel filters.
- D. [Bag] [Cartridge] type arrangement with holding frames suitable for [2" (50 mm)], [4" (100 mm)] prefilter and final filter media and blank-off sheets, extended surface [bag] [cartridge] media filters with [60-65] [80-85] [90-95] percent dust spot efficiency. Bag filter media [12" (305 mm)] [15" (381 mm)] [19" (483 mm)] [22" (559 mm)] [30" (762 mm)] [36" (914 mm)] deep. Cartridge filter media is [4" (50 mm)] [12" (305 mm)] deep. [Provide microbial resistant Intersept® coating on all filters.] Designed for [side] [front] loading of filters.
- E. [Furnish combination filter section with 2-inch flat pre-filter and 12-inch HEPA - 99.97% coefficient (MERV 16) final filter. Provide front-loading and removal of filters. Filter media shall be UL 900 listed, Class I or Class II.]
- F. [Manufacturer shall supply minihelic gauge to read pressure drop across the filter bank for scheduling filter replacement. Design shall be equal to a Dwyer Minihelic 2 and be recessed into the cabinet to minimize chances for damage during shipment and

installation.]

- G. [Manufacturer to provide and mount ultraviolet lights on the entering air side of the filter. Ultraviolet lights must meet agency approved to UL category Code ABQK specification, HVAC Accessories, Air Duct Mounted.]

2.10 [GAS-PHASE FILTRATION]

- A. Side access tracks shall accommodate AAF International's [Cleanroom Grade (CG)] [Medium Duty (MD)] [Heavy Duty (HD)] gas-phase filter cassettes.
- B. The filter enclosure shall include side access extruded aluminum tracks to support the gas phase filter cassettes. Each gas phase filter shall be supported by two upper and lower extruded aluminum tracks i.e. two support tracks at the inlet face and two support and sealing tracks at the outlet face.
- C. These tracks shall incorporate formed profile features to ensure that the filters are properly sealed into the enclosure. Simple 'L' tracks or angle supports that permit high leakage and inefficient sealing integrity are not permitted. The filter tracks shall ensure that the gas phase filter cassettes are permanently fixed in position and sealed to minimize bypass of air around the filters and to ensure that the entire contaminated air-stream passes through the filters.
- D. Each filter track shall include two hard-extruded type POM plastic strips embedded into, and protruding above, the horizontal surface of the track. These strips will minimize the surface area in contact with the filter cassettes and provide a plastic sliding surface with inherent lubricating properties to minimize friction and facilitate ease of installation and removal when sliding the gas phase filters into and out of the tracks.
- E. The filter outlet face (or downstream) upper and lower support and sealing tracks will each include a tubular, compressible, EPDM gasket inserted into a formed cavity in the sealing face of the track. Each of these tracks shall also include a vertical extruded aluminum flange that shall guide the gas phase filter into position and position the filter to guarantee that the tubular gasket is adequately compressed to seal between the filter and the track to minimize any by-pass of unfiltered air. The tubular gasket shall be treated with a polymer coating to reduce friction when sliding the gas phase filter into the track.
- F. The vertical flange in the track shall fit into notches located on the gas phase filter cassette and ensure that the cassette is properly positioned in the track. The tubular gasket shall be compressed by the action of installing the gas phase cassette into the side access tracks.
- G. The cassette shall be formed completely from injection molded, recyclable (or incinerable), high-impact polystyrene (HIPS). The plastic components that form the cassette shall be connected together using internal high pressure, snap-lock connectors formed into the connecting components. No glues

or solvents shall be allowed to be used in the manufacture or construction of the cassette to prevent contamination of both the chemical media and the air-stream by off-gassing of VOCs.

- H. All surfaces of the cassette should be true and offer external squareness. The cassette construction shall be of precision close tolerance construction having external dimensional and square ness tolerances of +/- 2mm. The cassette shall be capable of operating effectively in humidity range of 5% - 99% and temperature range of -5°F (-20°C) to 130°F (55°C).
- I. Chemical media shall be supported between aerodynamically tapered screens with very low drag coefficient (for energy efficiency). Injection molded high-impact polystyrene screens shall form individual media beds assembled into a V-bank configuration.
- J. No nose cavities shall be allowed in cassettes. The inlet and outlet screens shall be parallel and the inlet and outlet face areas shall be equal to ensure equal and complete utilization of the chemical media. The screen openings shall have a maximum width of 2-mm to ensure full retention of the chemical media and to eliminate downstream fouling.
- K. The screens shall be structurally reinforced with molded plastic ribs to minimize deflection of the screen caused by the weight of the chemical media. The ribs shall span in both directions and shall be orthogonal to each other. The inlet and outlet screens shall have a minimum thickness of 1.90-mm. A spacer shall be utilized at 150-mm intervals to accurately distance the two screens and maintain squareness and a constant bed depth after filling with chemical media.
- L. The side plates of the cassette shall be completely flat and planar and without protrusions to ensure that adjacent cassette mate accurately. All flanges shall be internal. No external flanges shall used. A 25mm wide gasket shall be mounted on each side plate to seal between adjacent cassettes. A scribed line formed into the side plate during molding shall determine the accurate positioning of the gasket. The gasket shall extend completely from the bottom to the top of the side plate and the edge of the gasket shall be contiguous with the face of the cassette. The gasket material shall be adhesive coated (with an acryl-based adhesive), semi-closed-cell EPDM foam and shall have a Durometer of 50-70. The material shall have good resistance to UV, humidity, high and low temperatures, and chemicals such as acids and alkalis, and fats and grease.
- M. A V-shaped Butterfly® Gasket shall be located horizontally along the upper and lower edges of the air leaving, or sealing, face of the cassette when the cassette is oriented for horizontal airflow. Two (2) 10-mm long, 0.5-mm thick, flexible "wings" shall be molded into a 16-mm wide, 1.5mm thick, base. When the cassette is installed the wings of the Butterfly gasket shall engage and envelop the tubular gasket that is installed in the extruded aluminum track providing a complete seal. The Butterfly gasket shall be extruded Polyurethane plastic.

- N. No heavy metals (such as Cadmium) nor regulated substances, such as CFC's and halogen gases shall be used during the manufacturing process nor be contained in the product itself.
- O. Cassette side plates shall not incorporate the cassette filling ports. Chemical media filling ports shall be located on the face of the cassette. The ports shall be covered and sealed using reinforced injection molded polypropylene covers. The covers shall be fixed to the cassette at a minimum of three locations, being each end and in the center, with high strength, bayonet style, plastic rivets. The bayonet shall cause the rivet to expand and form a tight connection. The end of the bayonet shall be barbed to prevent withdrawal and loosening of the connection, it shall also completely plug the center of the rivet and prevent air leakage through the rivet.
- P. The sealing perimeter of the cassette face shall be completely planar with top, bottom and side flange faces being completely flush. No setbacks or gaps shall be allowed. The outer edges of the top and bottom flanges shall be completely flush with the top and bottom surfaces of the cassette.
- Q. The cassette shall include a precision molded slot positioned to accept a guide located on the surface of the support track. The slot and guide combination will ensure that the cassette is accurately positioned in the mounting track ensuring full contact and proper compression of the track-mounted gasket.
- R. Physical characteristics and performance shall be as follows: [Cleanroom Grade (CG) Cassette – Nominal size 24"H × 12"W × 12"D with media holding capacity of 0.7 cubic feet in a 1" thick 'V' bank arrangement. Rated pressure drop at 500 fpm shall be [0.047 utilizing SAAFOxidant] [0.56 utilizing SAAFCarb] [0.57 utilizing SAAFBBlend] Chemical Media. Chemical media utilization index shall be 92% or greater.] [Medium Duty (MD) Cassette – Nominal size 6"H × 24"W × 18"D with media holding capacity of 0.5 cubic feet in a 1" thick 'V' bank arrangement. Rated pressure drop at 500 fpm shall be [0.031 utilizing SAAFOxidant] [0.35 utilizing SAAFCarb] [0.34 utilizing SAAFBBlend] Chemical Media. Chemical media utilization index shall be 92% or greater.] [Heavy Duty (HD) Cassette – Nominal size 12"H × 24"W × 12"D with media holding capacity of 1.0 cubic feet in a 3" thick 'V' bank arrangement. Rated pressure drop at 250 fpm shall be [0.073 utilizing SAAFOxidant] [0.87 utilizing SAAFCarb] [0.97 utilizing SAAFBBlend] Chemical Media. Chemical media utilization index shall be 92% or greater.]

2.11 ADDITIONAL SECTIONS

- A. [Mixing box section shall be provided with [end] [top] [bottom] [left] [right] [no] outside air opening and [end] [top] [bottom] [left] [right] [no] return air opening.
- 1. [Outside air] [Return air] damper[s] shall be low leak, hollow core galvanized steel airfoil blades, fully gasketed and have continuous vinyl seals between damper blades in a galvanized steel frame. Dampers shall have stainless steel jamb seals along end of dampers. Connecting linkage and ABS plastic end caps shall be provided when return and outside air dampers are each sized for full airflow. Return and outside air dampers of different sizes must be driven separately. Damper Leakage: Leakage rate shall be less than two tenths of one percent leakage at 2 inches static pressure differential. Leakage rate tested in accordance with AMCA Standard 500.
- 2. [Outside air] [Return air] damper[s] shall be Tamco 9000, [parallel] [opposed] blade, thermally insulated control damper. Return and outside air dampers must be driven separately.
 - a. Extruded aluminum (6063-T5) damper frame is not less than 0.080" (2.03 mm) in thickness. Damper frame is 4" (101.6 mm) deep × 1" (25.4 mm), with mounting flanges on both sides of frame.
 - b. Blades are extruded aluminum (6063-T5) airfoil profiles, internally insulated with expanded polyurethane foam and thermally broken. Complete blade has an insulating factor of R-2.29 and a temperature index of 55 (tested to AAMA 1502.7 Test Method).
 - c. Blade seals are extruded EPDM. Frame seals are extruded silicone. Seals are secured in an integral slot within the aluminum extrusions. Blade and frame seals are mechanically fastened to prevent shrinkage and movement over the life of the damper.
 - d. Bearings are composed of a Celcon inner bearing (fixed around a 7/16" (11.11 mm) aluminum hexagon blade pivot pin) rotating within a polycarbonate outer bearing inserted in the frame. This eliminates action between metal-to-metal or metal-to-plastic riding surfaces.
 - e. Adjustable 7/16" (11.11 mm) hexagonal drive rod, U-bolt fastener, and hexagonal retaining nuts are zinc-plated steel. These provide a positive connection to blades and linkage.
 - f. Aluminum and corrosion-resistant zinc-plated steel linkage hardware is installed in the frame side, complete with cup-point trunnion screws for a slip-proof grip.
 - g. Dampers are designed for operation in temperatures ranging from -40°F (-40°C) to 212°F (100°C).
 - h. Leakage Class 1A at 1 in w.g. (0.25 kPa) static pressure differential. Standard air leakage data is certified under the AMCA

- Certified Ratings Program.
- i. Dampers are custom made to required size, without blanking off free area.
 3. [Outside air] [Return air] damper[s] shall be Tamco 1000, [parallel] [opposed] blade, low leak airfoil control damper. Return and outside air dampers must be driven separately.
 - a. Extruded aluminum (6063-T5) damper frame is not less than 0.080" (2.03 mm) in thickness. Damper frame is 4" (101.6 mm) deep × 1" (25.4 mm), with mounting flanges on both sides of frame.
 - b. Blades are extruded aluminum (6063-T5) airfoil profiles.
 - c. Blade seals are extruded EPDM. Frame seals are extruded silicone. Seals are secured in an integral slot within the aluminum extrusions. Blade and frame seals are mechanically fastened to prevent shrinkage and movement over the life of the damper.
 - d. Bearings are composed of a Celcon inner bearing (fixed around a 7/16" (11.11 mm) aluminum hexagon blade pivot pin) rotating within a polycarbonate outer bearing inserted in the frame. This eliminates action between metal-to-metal or metal-to-plastic riding surfaces.
 - e. Adjustable 7/16" (11.11 mm) hexagonal drive rod, U-bolt fastener, and hexagonal retaining nuts are zinc-plated steel. These provide a positive connection to blades and linkage.
 - f. Aluminum and corrosion-resistant zinc-plated steel linkage hardware is installed in the frame side, complete with cup-point trunnion screws for a slip-proof grip.
 - g. Dampers are designed for operation in temperatures ranging from -40°F (-40°C) to 212°F (100°C).
 - h. Leakage Class 1A at 1 in w.g. (0.25 kPa) static pressure differential. Standard air leakage data is certified under the AMCA Certified Ratings Program.
 - i. Dampers are custom made to required size, without blanking off free area.
 4. [Outside air] [Return air] damper[s] shall be Ruskin CD60, [parallel] [opposed] blade, low leak airfoil control damper. Return and outside air dampers must be driven separately.
 - a. Control dampers shall be produced in an ISO9001 certified factory.
 - b. Frame shall be one-piece uniframe construction of 16 ga. (1.6) galvanized steel roll formed hat channel structurally equivalent to a minimum 13 ga. (2.4) frame.
 - c. Blades shall be 14 ga. (2.0) equivalent galvanized steel, roll-formed airfoil type for low pressure drop and low noise generation.
 - d. Blade edge seals shall be Ruskiprene™ TPV type or equivalent mechanically locked into the blade edge. Adhesive or clip-on type seals are unacceptable.
 - e. Jamb seals shall be stainless steel chambered compression type to prevent leakage between blade end and damper frame. Blade end overlapping frame is unacceptable.
 - f. Multiple section dampers must have factory installed jackshafts unless clearly eliminated by engineer.
 - g. Bearings shall be 304 stainless steel, oil impregnated, and self-lubricating sleeve type with a 450 pound (204 kg) minimum radial crush load. Bearings shall turn in extruded holes in the damper frame.
 - h. Axles shall be hexagonal positively locked into the damper blade.
 - i. Linkage shall be concealed out of airstream, within the damper frame to reduce pressure drop and noise.
 - j. Temperature limits shall be -72°(-58°C) to +275°F (+135°C).
 - k. Damper shall be tested and licensed in accordance with AMCA 511 for Air Performance and Air Leakage.
 - l. Damper widths from 12" to 60" (305 to 1524) wide shall not leak any greater than 3 cfm/sq.ft. at 1" w.g. (15.2 l/s-m2 at .25 kPa).
 5. [Outside air] [Return air] damper[s] shall be Greenheck VCD33 [stainless steel] [galvanized], [parallel] [opposed] blade, low leak airfoil control damper. Return and outside air dampers must be driven separately.
 - a. Dampers shall consist of: a 16 ga. (1.5mm) [galvanized steel] [304 stainless steel] channel frame with 5 in. (127mm) depth; airfoil shaped, [galvanized steel] [304 stainless steel] double skin construction blades (14 ga. [2mm] equivalent thickness); blades shall be completely symmetrical relative to their axle pivot point, presenting identical resistance to airflow in either direction or pressure on either side of the damper; 1/2 in. (6mm) dia. plated steel axles turning in synthetic (acetal) sleeve bearings; TPE blade seals for 200°F (93°C) maximum temperature; flexible stainless steel jamb seals; and external (out of the airstream) blade-to-blade linkage.
 6. [Outside air] [Return air] damper[s] shall be Greenheck VCD43 aluminum, [parallel] [opposed] blade, low leak airfoil control damper. Return and outside air dampers must be driven separately.
 - a. Dampers shall consist of: heavy gauge aluminum frame (0.125 in. [3.2mm] thick) with 5 in. (127mm) depth formed into a structural hat channel shape; airfoil shaped, extruded aluminum blades (0.063 in. [1.6mm] thick) with metal blade to blade overlap (seal to seal only contact is not acceptable); blades shall be completely symmetrical relative to their axle pivot point, presenting identical resistance to airflow and operation in either

direction through the damper (blades that are non-symmetrical relative to their axle pivot point or utilize blade stops larger than 1/2 in. (13mm) are unacceptable); 1/2 in. (13mm) dia. plated steel axles turning in synthetic (acetal) sleeve bearings; TPE blade seals; flexible stainless steel jamb seals; and external (out of the airstream) blade-to-blade linkage.

7. [Outside air] [Return air] opening[s] shall be provided without a damper.]
- B. [Economizer section shall be provided with [end] [top] [bottom] [left] [right] [internal] [no] outside air opening, [end] [top] [bottom] [left] [right] [internal] [no] return air opening and [end] [top] [bottom] [left] [right] [internal] [no] exhaust air opening.
 1. [Outside air] [Return air] [Exhaust air] damper[s] shall be low leak, hollow core galvanized steel airfoil blades, fully gasketed and have continuous vinyl seals between damper blades in a galvanized steel frame. Dampers shall have stainless steel jamb seals along end of dampers. Linkage and ABS plastic end caps shall be provided when return and outside air dampers sized for full airflow. Return and outside air dampers of different sizes or very large dampers and exhaust dampers must be driven separately. Damper Leakage: Leakage rate shall be less than two tenths of one percent leakage at 2 inches static pressure differential. Leakage rate tested in accordance with AMCA Standard 500.
 2. [Outside air] [Return air] [Exhaust air] damper[s] shall be Tamco 9000, [parallel] [opposed] blade, thermally insulated control damper. Return, outside, and exhaust air dampers must be driven separately.
 - a. Extruded aluminum (6063-T5) damper frame is not less than 0.080" (2.03 mm) in thickness. Damper frame is 4" (101.6 mm) deep x 1" (25.4 mm), with mounting flanges on both sides of frame.
 - b. Blades are extruded aluminum (6063-T5) airfoil profiles, internally insulated with expanded polyurethane foam and thermally broken. Complete blade has an insulating factor of R-2.29 and a temperature index of 55 (tested to AAMA 1502.7 Test Method).
 - c. Blade seals are extruded EPDM. Frame seals are extruded silicone. Seals are secured in an integral slot within the aluminum extrusions. Blade and frame seals are mechanically fastened to prevent shrinkage and movement over the life of the damper.
 - d. Bearings are composed of a Celcon inner bearing (fixed around a 7/16" (11.11 mm) aluminum hexagon blade pivot pin) rotating within a polycarbonate outer bearing inserted in the frame. This eliminates action between metal-to-metal or metal-to-plastic riding surfaces.
 - e. Adjustable 7/16" (11.11 mm) hexagonal drive rod, U-bolt fastener, and hexagonal retaining nuts are zinc-plated steel. These provide a positive connection to blades and linkage.
 3. [Outside air] [Return air] [Exhaust air] damper[s] shall be Tamco 1000, [parallel] [opposed] blade, low leak airfoil control damper. Return, outside, and exhaust air dampers must be driven separately.
 - a. Extruded aluminum (6063-T5) damper frame is not less than 0.080" (2.03 mm) in thickness. Damper frame is 4" (101.6 mm) deep x 1" (25.4 mm), with mounting flanges on both sides of frame.
 - b. Blades are extruded aluminum (6063-T5) airfoil profiles.
 - c. Blade seals are extruded EPDM. Frame seals are extruded silicone. Seals are secured in an integral slot within the aluminum extrusions. Blade and frame seals are mechanically fastened to prevent shrinkage and movement over the life of the damper.
 - d. Bearings are composed of a Celcon inner bearing (fixed around a 7/16" (11.11 mm) aluminum hexagon blade pivot pin) rotating within a polycarbonate outer bearing inserted in the frame. This eliminates action between metal-to-metal or metal-to-plastic riding surfaces.
 - e. Adjustable 7/16" (11.11 mm) hexagonal drive rod, U-bolt fastener, and hexagonal retaining nuts are zinc-plated steel. These provide a positive connection to blades and linkage.
 - f. Aluminum and corrosion-resistant zinc-plated steel linkage hardware is installed in the frame side, complete with cup-point trunnion screws for a slip-proof grip.
 - g. Dampers are designed for operation in temperatures ranging from -40°F (-40°C) to 212°F (100°C).
 - h. Leakage Class 1A at 1 in w.g. (0.25 kPa) static pressure differential. Standard air leakage data is certified under the AMCA Certified Ratings Program.
 - i. Dampers are custom made to required size, without blanking off free area.

4. [Outside air] [Return air] [Exhaust air] damper[s] shall be Ruskin CD60, [parallel] [opposed] blade, low leak airfoil control damper. Return, outside, and exhaust air dampers must be driven separately.
 - a. Control dampers shall be produced in an ISO9001 certified factory.
 - b. Frame shall be one-piece uniframe construction of 16 ga. (1.6) galvanized steel roll formed hat channel structurally equivalent to a minimum 13 ga. (2.4) frame.
 - c. Blades shall be 14 ga. (2.0) equivalent galvanized steel, roll-formed airfoil type for low pressure drop and low noise generation.
 - d. Blade edge seals shall be Ruskiprene™ TPV type or equivalent mechanically locked into the blade edge. Adhesive or clip-on type seals are unacceptable.
 - e. Jamb seals shall be stainless steel chambered compression type to prevent leakage between blade end and damper frame. Blade end overlapping frame is unacceptable.
 - f. Multiple section dampers must have factory installed jackshafts unless clearly eliminated by engineer.
 - g. Bearings shall be 304 stainless steel, oil impregnated, and self-lubricating sleeve type with a 450 pound (204 kg) minimum radial crush load. Bearings shall turn in extruded holes in the damper frame.
 - h. Axles shall be hexagonal positively locked into the damper blade.
 - i. Linkage shall be concealed out of airstream, within the damper frame to reduce pressure drop and noise.
 - j. Temperature limits shall be -72°(-58°C) to +275°F (+135°C).
 - k. Damper shall be tested and licensed in accordance with AMCA 511 for Air Performance and Air Leakage.
 - l. Damper widths from 12" to 60" (305 to 1524) wide shall not leak any greater than 3 cfm/sq.ft. at 1" w.g. (15.2 l/s-m2 at .25 kPa).
5. [Outside air] [Return air] [Exhaust air] damper[s] shall be Greenheck VCD33 [stainless steel] [galvanized], [parallel] [opposed] blade, low leak airfoil control damper. Return, outside, and exhaust air dampers must be driven separately.
 - a. Dampers shall consist of: a 16 ga. (1.5mm) [galvanized steel] [304 stainless steel] channel frame with 5 in. (127mm) depth; airfoil shaped, [galvanized steel] [304 stainless steel] double skin construction blades (14 ga. [2mm] equivalent thickness); blades shall be completely symmetrical relative to their axle pivot point, presenting identical resistance to airflow in either direction or pressure on either side of the damper; 1/2 in. (6mm) dia. plated steel axles turning in synthetic (acetal) sleeve bearings; TPE blade seals for 200°F (93°C) maximum temperature; flexible stainless steel jamb seals; and external (out of the airstream) blade-to-blade linkage.
6. [Outside air] [Return air] [Exhaust air] damper[s] shall be Greenheck VCD43 aluminum, [parallel] [opposed] blade, low leak airfoil control damper. Return, outside, and exhaust air dampers must be driven separately.
 - a. Dampers shall consist of: heavy gauge aluminum frame (0.125 in. [3.2mm] thick) with 5 in. (127mm) depth formed into a structural hat channel shape; airfoil shaped, extruded aluminum blades (0.063 in. [1.6mm] thick) with metal blade to blade overlap (seal to seal only contact is not acceptable); blades shall be completely symmetrical relative to their axle pivot point, presenting identical resistance to airflow and operation in either direction through the damper (blades that are non-symmetrical relative to their axle pivot point or utilize blade stops larger than 1/2 in. (13mm) are unacceptable); 1/2 in. (13mm) dia. plated steel axles turning in synthetic (acetal) sleeve bearings; TPE blade seals; flexible stainless steel jamb seals; and external (out of the airstream) blade-to-blade linkage.
7. [Outside air] [Return air] [Exhaust air] opening[s] shall be provided without a damper.]
- C. [Access section shall provide access between components shall be a minimum of [16" (406mm)] [24" (610mm)] [30" (762mm)] [36" (914mm)] [42" (1067mm)] [48" (1219mm)] [54" (1372mm)] deep. Access doors of galvanized steel for flush mounting, with gasket, latch and full size (minimum of 4.5") handle assembly. [Provide stainless steel drip pan in access section.] [Floor shall be lined with .125-inch aluminum tread plate to accommodate walk-in weight of service technician.]
- D. [Diffuser section shall be mounted on leaving side of supply fan section providing uniform air distribution across downstream components. Perforated diffuser plate shall be secured over blast area of fan to disperse airflow.]
- E. [Blender / air mixer section to provide proper air mixing and distribution of the outside and return airstreams. Proper spacing provided in the direction of airflow as recommended by the blender manufacturer (Blender Products or Kees).]
- F. [Sound attenuator section(s) shall be provided by the air handling unit manufacturer as an integral section of the unit to attenuate fan noise at the source. Provide acoustic performance and air pressure drop as scheduled. Silencer acoustic insulation shall be covered with perforated sheet metal. [Provide [mylar] [tedlar] [fiberglass cloth] liner between perforated sheet metal and acoustic insulation].
- G. [Manual section shall be provided by the air handling unit manufacturer as an integral section of the unit for field installation of special components. Section length to be determined by component supplier.]

- H. [[Inlet] [Discharge] plenum section shall be provided as the [first] [last] section in the direction of airflow. The plenum shall provide single or multiple [top] [end] [bottom] openings.]
- I. [Face and bypass section shall be provided to modulate airflow through and around heat transfer coils. Dampers shall be an integral part of the unit assembly. [Internal face and bypass shall be contained in the standard cabinet height] [External face and bypass arrangement shall be provided with factory provided bypass duct of same cabinet construction as the remainder of the unit. Field installed bypass ducts are not acceptable]. Blank-off and division sheets, internal linkage, access [panel] [doors] installed by unit manufacturer. Face and bypass dampers shall be of low leak design, opposed blade, with vinyl bulb edging and stainless steel edge seals, galvanized steel frame and axles in self-lubricating nylon bearings.]
- J. [Humidifier Steam Dispersion Panel (Short Absorption Manifold, SAM-e)
1. Short Absorption Manifold designed for atmospheric steam humidifiers or pressurized steam from a boiler, to directly inject the steam into ducted air for humidification. Performance shall be factory selected based on scheduled criteria.
 2. Absorption distance characteristic shall prevent water accumulation on any surfaces beyond the drain pan downstream of the steam dispersion panel.
 3. Steam dispersion panel consisting of a (one) horizontal stainless steel header supplying steam to a bank of closely spaced vertical tubes, as necessary to meet absorption distance requirements, and to reduce condensation losses.
 4. Dual header systems creating unnecessary condensation or systems needing to be installed on a partition or requiring blank off plates are not acceptable.
 5. Header design shall be round tube to minimize pressure drop. Square headers are not acceptable.
 6. Steam inlet and condensate return located on the same side and at the bottom of the header to allow single point entry and floor mounting.
 7. Headers shall be 304 stainless steel construction.
 8. Vertical 304 stainless steel distribution tubes shall be provided to promote condensate evacuation. Horizontal distributor tubes are not acceptable.
 9. Distribution tubes shall include threaded standoffs for trouble free attachment to factory supplied support bracket.
 10. Stainless steel nozzle inserts ensure condensate free steam is discharged from the center of the distribution tubes. Systems without nozzle inserts, or other than stainless steel, are not acceptable.
 11. Stainless steel nozzle inserts shall have metered orifices, sized to provide even distribution of the discharged steam, spaced for optimum steam absorption.
12. Comply with AHRI 640, "Standard for Commercial and Industrial Humidifiers.]"
- K. [Energy Recovery]
1. [Fixed Plate air-to-air heat exchanger shall be constructed of rigid thermally bonded plates separated by aluminum spacers. Exposed folded or crimped edges are not acceptable. The exchanger corrugations shall be bonded to the flat plates with a thermal adhesive and be capable of withstanding pressure differentials of up to 15" w.g. without deforming air passages. The entire heat transfer surface shall be capable of visible inspection and cleaning. Factory personnel shall calculate fixed plate temperature and pressure drop performance.]
 2. [Flat plate energy recovery device heat transfer surface shall be formed aluminum plates with enhanced surface corrugation for increased performance. Exchanger frame profiles shall be all aluminum with sheet metal end plates. Exchanger shall be capable of withstanding a pressure difference between airflows of up to 7.2" w.g. without deforming air passages. Standard cell construction shall have a maximum cross contamination between airflows of 0.1% of total airflow. The entire cell shall be capable of being visibly inspected and cleaned as required.]
 3. [The enthalpy plate exchanger shall transfer both sensible and latent energy between the incoming fresh air stream and the exhaust stale air stream. The ERV core shall be in either a cross-flow or counter cross-flow orientation and have no moving parts. The ERV core shall be certified by AHRI under its Standard 1060 for Energy Recovery Ventilators. Products not currently AHRI certified will not be accepted. The fresh air stream must have complete separation from the stale air stream to prevent cross contamination. The ERV core shall have a 0% Exhaust Air Transport Ratio as tested to AHRI 1060-2005 (EATR) to prevent cross-over of gases, contaminants or odors. The ERV core shall inhibit mold and bacteria growth as tested to Standard AATCC 30 with 100% surface inhibition on the Aspergillus mold test and 100% surface inhibition the Kirby Bauer Staphylococcus bacteria test. The ERV core must be able to tolerate freezing temperatures of -30C and not have an increase in EATR or decrease in performance after being frozen. The ERV core must be able to tolerate high temperatures of +60C and not have an increase in EATR or decrease in performance at these elevated temperatures. The ERV core must be water washable to remove dust and contaminants. The ERV core must be flame proof and comply with UL 723 with a flame spread index that shall not be over 25 and a smoke index that shall not be over 50. The ERV shall have a frame consisting of 5052 series aluminum end plates and aluminum alloy 6063 extruded side rails.]

4. [Energy recovery wheel shall be constructed of corrugated synthetic fibrous media, with a desiccant intimately bound and uniformly and permanently dispersed throughout the matrix structure of the media. Rotors with desiccants coated bonded, or synthesized onto the media are not acceptable due to delaminating or erosion of the desiccant material. Media shall be synthetic to provide corrosion resistance and resistance against attack from laboratory chemicals present in pharmaceutical, hospital, etc. environments as well as attack from external outdoor air conditions. Coated aluminum is not acceptable. Face flatness of the wheel shall be maximized in order to minimize wear on inner seal surfaces and to minimize cross leakage. Rotor shall be constructed of alternating layers of flat and corrugated media. Wheel layers should be uniform in construction forming uniform aperture sizes for airflow. Wheel construction shall be fluted or formed honeycomb geometry so as to eliminate internal wheel bypass. Wheel layers that can be separated or spread apart by airflow are unacceptable due to the possibility of channeling and performance degradation. The minimum acceptable performance shall be as specified in the unit schedule.

Desiccant Material: The desiccant material shall be a molecular sieve, and specifically a 4A or smaller molecular sieve to minimize cross contamination.

Wheel Media Support System: The wheel frames shall consist of evenly spaced steel spokes, galvanized steel outer band and rigid center hub. The wheel construction should allow for post fabrication wheel alignment.

Wheel Seals: The wheel seals shall be full contact nylon brush seals or equivalent. Seals should be easily adjustable.

Wheel cassette: Cassettes shall be fabricated of heavy duty reinforced galvanized steel or welded structural box tubing. [Cassettes shall have a built in adjustable purge section minimizing cross contamination of supply air.] Bearings shall be inboard, zero maintenance, permanently sealed roller bearings, or alternatively, external flanged or pillow block bearings.

Drive systems shall consist of fractional horsepower AC drive motors with multi-link drive belts.

[Bypass dampers shall be furnished.]

Certification: The wheel shall be AHRI certified by the energy recovery wheel supplier to AHRI Standard 1060 and must bear the AHRI certification stamp. Private independent testing performed "in accordance with" various standards is not a substitute for AHRI certification and shall not be accepted. The wheel shall be listed or recognized by UL or equivalent.]

5. [Energy recovery wheel heat exchanger shall be constructed of alternate layers of corrugated and flat aluminum sheet material. Both sides of the exchanger shall be completely smooth with less than 0.005" variation between alternate layers to allow for optimum sealing surface for brush seals. The rotor shall have smooth air channels to ensure laminar airflow for low-pressure drops. Dry particles up to 900 microns shall pass freely through the rotor without clogging the media. The rotor media shall be capable of being cleaned with low temperature steam without degrading unit performance. The rotor media must be made of aluminum that is coated to prohibit corrosion. All surfaces shall be coated with a non-migrating absorbent specifically developed for the selective transfer of water vapor.

Performance shall be as scheduled and verified by manufacturer. Assuming equal sensible and latent recovery effectiveness shall not derive performance.

The rotor housing shall be constructed using a heavy-duty extruded and anodized aluminum tube frame (rotors less than 42" shall have a heavy duty galvanized frame without insulation) with double wall galvanized sheet metal panels with fiberglass insulation. Adjustable brush seals must be provided along the periphery of the rotor and between the inlet and outlet air passages to effectively prevent air leakage and cross-contamination between airflows. Total airflow between air streams from leakage and purge shall be less than 10% at 2.5" w.g. differential pressure between airflows. Rotor and casing shall be reinforced to prevent deflection from differential pressures to less than 0.03 inches. All rotors shall be mounted on sealed permanently lubricated spherical bearings. All rotors over 80" in diameter must have flanged or pillow block bearings that can be serviced or replaced without removal of the rotor from the case.

[The unit must be provided with a factory set, field adjustable purge sector designed to limit cross contamination at qualified appropriate design conditions to less than 0.04 percent of the exhaust air stream concentration. Independent laboratory evaluations must indicate purge sector configurations, rotor construction, gasses, air pressure differentials, rotor speeds and other phenomena that constitute "appropriate design conditions" required to limit cross-contamination and air leakage.]

The rotor drive system shall consist of a self-adjusting belt around the rotor perimeter driven by an AC motor with gear reduction. The variable speed drive shall be specifically designed for heat wheel applications and include: an AC inverter, soft start/stop, rotation detection w/alarm contacts, automatic self-cleaning jog cycle, and self testing capability. The speed controller shall be capable of accepting a potentiometer, VDC, or mA control signal.

[The temperature control system shall consist of an integral control panel with remote temperature

sensors mounted in each of the four air streams to monitor exchanger performance. The control shall modulate rotor speed to (1) prevent frost build-up, (2) reduce heat recovery for economizer mode, and (3) switch to maximum heat recovery when outdoor temperature is higher than indoor temperature. A digital display keypad for monitoring temperatures and changing set points shall be included.]

[Bypass dampers shall be furnished.]

AHRI Certification: Sensible and latent recovery effectiveness must be clearly certified by the energy recovery wheel supplier through AHRI in accordance with AHRI Standard 1060.]

2.12 DAMPERS

- A. Damper Leakage: Leakage rate shall be less than two tenths of one percent leakage at 2 inches static pressure differential. Leakage rate tested in accordance with AMCA Standard 500.
- B. [Multi-Zone Dampers: Zone dampers for use with [2 deck] or [3 deck], vertical or horizontal system. Factory mounted in casing of galvanized steel blades [with vinyl bulb edging]. Low leak dampers with bronze end and side seals, locked in position to common shaft with rotation angles of 90°, requiring one actuator per zone. Damper rods rotate in nylon bushings.]

2.13 CONTROLS

- A. [Manufacturer shall furnish and mount 24V control components that shall be terminated at a sealed junction box on the unit exterior of each section in which the component is mounted. The components include low temperature limits (freeze-stats), air proving switches, discharge air, return air, exhaust air temperature sensors, and CO2 sensors as specified in the control schedule. The control components must be compatible with [Alerton] [Automated Logic] [Honeywell] [Invensys] [Johnson Controls] [Siemens] as indicated in the control specification. [The manufacturer shall furnish and mount [Belimo] [Johnson Controls] actuators for all dampers.]

2.14 SORBENT VENTILATION

- A. Indoor air quality performance shall be in compliance with ASHRAE 62.1-2016 and relevant addenda via the Indoor Air Quality Procedure (IAQP).
- B. Air Cleaning Solution and Mechanism shall be fully compliant with ASHRAE Standard for Gas Phase Filtration: ASHRAE Standard 145.2 – 2011.
- C. Air Cleaning Solution shall be certified as zero-byproduct emitting by 3rd Party Certified Lab. Zero-byproduct certification letter required to be submitted to Engineer of Record and equipment Owner and/or Operator.
- D. Mechanism for air cleaning shall be capture and release; air cleaning solution alternates shall not alter the chemistry or composition of airborne

gaseous substances. Alternate air-manipulative or catalytic type cleaners shall not be approved (i.e. plasma cleaners, ionizers, etc.)

- E. Solution shall not emit Ozone and/or Reactive Oxygen Species (ROS) of any kind; processes and mechanisms that emit ozone/ROS or have the potential to emit ozone or ROS are not acceptable.
- F. Solution shall have the capability to be automatically regenerated (self-cleaned) in-situ; replacement of cleaning mechanism or sorbent media shall not be required more than once per year.
- G. Gas-phase cleaning efficiencies must meet the following minimums for single-pass air cleaning of the following contaminants of concern:
 - Carbon Dioxide to have a measured standard challenge concentration of 1000 ppb, with a cartridge efficiency of 57%.
 - Formaldehyde to have a measured standard challenge concentration of 121 ppb, with a cartridge efficiency of 55%.
- H. Cartridge Bank:

The cartridge bank shall house twelve (12) quantity cartridges that contain the sorbents used to capture molecular level contaminants (CO2, formaldehyde, VOCs, ozone, etc. as defined by ASHRAE Standard 62.1-2016) during the sorption (cleaning) process and then released during the regeneration (airflow purge or exhaust) process.
- I. Heater:

An integrated heater shall raise the internal temperature of the unit to initiate the release of captured contaminants by molecular thermal excitation. The heater shall be controlled using a PID controller loop to maintain the internal temperature. Temperature control shall be an on-board software-based function. Controller shall contain 3-modes of safety protection with respect to heater control that are mechanical in nature to ensure safe operation:

 - An airflow switch that ensures the heater is disabled when there is insufficient airflow inside the unit.
 - A resettable thermal switch shall disconnect the heater when the temperature exceeds a preset limit and will only allow the heater to operate once a safe temperature has been reached.
 - A one-time blow fuse shall permanently disconnect the heater in the event the two primary safety functions fail to work.
- J. Fans:

Integrated DC brushless motor driven fans shall control airflow through the unit during the adsorption and regeneration cycles. The fans are controlled using pulse width modulation for variable speed and are safety listed. The fan motors shall contain on-board locked rotor protection to prevent damage to the unit in the event of motor failure or the fan becomes blocked or locked in position.
- K. Inlets & Outlets:

The module shall include airflow damper inlets and airflow damper outlets controlled and modulated by mechanical actuator assemblies.

- L. Internal Damper:
An internal shunt damper shall be used during the regeneration cycle to enable the system to reach and maintain optimal temperature using airflow recirculation and mixing. The internal damper shall be controlled by an actuator allowing for analog position control to actively modulate the amount of recirculation during the regeneration.
- M. Control Board:
The electronic enclosure shall contain both the power supply and main controller board. The power supply converts the incoming AC power to all voltages required to operate all aspects of the unit including actuators, heater, fans, and sensors. The controller contains the systems software, all controls/relays/sensor interfaces, and all wireless and wired communication modules.
- N. Insulation:
All internal surfaces of the unit shall be covered in heat-reflective insulation material for improved efficiency and soundproofing. All outdoor-rated and weatherized equipment modules shall contain between-the-wall pressed insulation to maintain thermal efficiency.
- O. Outdoor-rated equipment modules shall have galvanized steel double-walled construction with 1000-hr salt spray rated power-coated paint. Indoor-based equipment modules are excluded from this specification.
- P. Power Requirements:
The unit shall be designed to work with single-phase AC power and should accommodate a range of line voltages and frequencies. Rated incoming line-voltage shall be 208-277V/ single phase at 60/50 Hz frequencies.
- Q. Airflow:
Module airflow performance shall be based on no more than 0.2" w.g. of external static pressure. Maximum airflow shall not exceed 1000 CFM of cleaning capacity with a design nominal airflow of 800 CFM per single unit. Regeneration Cycle design maximum airflow shall not exceed 500 CFM of exhaust capacity with a design nominal airflow of 300 CFM per single unit.

PART 3: EXECUTION

3.01 INSTALLATION

- A. Install in accordance with manufacturer's Installation & Maintenance instructions.

3.02 ENVIRONMENTAL REQUIREMENTS

- A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

Daikin Applied Training and Development

Now that you have made an investment in modern, efficient Daikin Applied equipment, its care should be a high priority. For training information on all Daikin Applied HVAC products, please visit us at www.DaikinApplied.com and click on Training, or call 540-248-9646 and ask for the Training Department.

Warranty

All Daikin Applied equipment is sold pursuant to its standard terms and conditions of sale, including Limited Product Warranty. Consult your local Daikin Applied representative for warranty details. To find your local Daikin Applied representative, go to www.DaikinApplied.com.

Aftermarket Services

To find your local parts office, visit www.DaikinApplied.com or call 800-37PARTS (800-377-2787). To find your local service office, visit www.DaikinApplied.com or call 800-432-1342.

This document contains the most current product information as of this printing. For the most up-to-date product information, please go to www.DaikinApplied.com.

Products manufactured in an ISO Certified Facility.
